1 PR Psychology

1.1 Deep Ethical PR Psychology Mechanics

Living working page · opened 19 October 2026 · designed to grow as further material arrives

> PR Psychology can be misused, weaponized, or occupy a partial gray area of ethics. Marketing firms, PR firms, advertising, media training, lobbying, political strategy, campaigns, polling, litigation communication, influencer management, sentiment analysis and newsjacking all overlap with it—and with mass psychology.
>
> **But what about Deep Ethical PR Psychology? How would that be different?**

— **John Kuhles**, originating page question and field map, 19 October 2026

Public relations is not only the publication of information. It also organizes **attention, salience, interpretation, trust, emotion, identification, legitimacy, memory and the range of actions an audience is encouraged to consider**.

That makes PR psychology wider than one profession. It operates wherever someone deliberately shapes the relationship between an object and a public: a company and its customers, a politician and voters, a lawsuit and potential jurors, a public-health message and a community, an activist and a movement, a creator and followers—or this project and a first-time visitor.

The proposed difference is not a purity claim:

> **Deep Ethical PR Psychology is purposeful public influence that keeps the source object, sponsor, interests, selected frame, material omissions, psychological leverage, affected audiences, uncertainty, intended next move, foreseeable consequences and correction routes sufficiently visible to remain open to informed refusal, challenge and revision.**

This is a **project proposal**, not a validated discipline, universal code, new licensing standard or certificate of ethical virtue.

1.2 1. The wider PR-psychology field

The fields below use different titles, laws and professional practices. Their overlap lies in the deliberate shaping of public attention, interpretation or action.

Field	Typical psychological operation	Deep-ethical question
Marketing firms	connect needs, identities and aspirations to an offer	Is the need represented, discovered, amplified or manufactured?
Public-relations firms	build legitimacy, trust and durable stakeholder relations	Which interests and material conflicts are visible to the public?
Advertising industry	capture attention and create recall, preference or urgency	Does emotional force outrun the evidence a consequential choice requires?
Media training for politicians and executives	rehearse delivery, bridging, composure and message discipline	Does training improve truthful communication or help the speaker evade the actual question?
Public affairs and lobbying firms	translate private interests into public and policy narratives	Can the public recover who is funding, designing and benefiting from the campaign?
Political-strategy consultants	segment constituencies, frame issues and identify persuasive pressure points	Are citizens treated as participants in democracy or targets whose vulnerabilities can be privately optimized?

Field	Typical psychological operation	Deep-ethical question
Campaign-management consultants	coordinate message, timing, repetition, opposition research and mobilization	Which claims are checked, which identities are activated, and what happens after the vote?
Market-research and polling companies	convert wording, ordering and response options into measurable opinion	Would different framing or omitted answer options produce a materially different “public opinion”?
Litigation communications	shape the public context surrounding legal conflict	Does communication protect legitimate access to public explanation while preserving due process and evidentiary uncertainty?
Influencer marketing and creator management	borrow intimacy, authenticity and community trust	Is the material relationship prominent enough to govern how the endorsement is interpreted?
Media monitoring and sentiment analysis	classify tone, trends, risk and reputational movement	What people, languages, contexts and forms of irony are lost inside the classifier?
Newsjacking strategy	attach a brand, cause or spokesperson to a live event	Is the event illuminated, opportunistically captured or emotionally exploited?
Political campaigns	combine identity, fear, hope, belonging, contrast and turnout operations	Can persuasion remain forceful without hiding sponsorship, manufacturing consent or degrading the opponent into a psychological object?
Crisis and reputation management	stabilize uncertainty, preserve trust and limit damage	Is the response protecting people and recoverable facts—or merely controlling what becomes visible?
Issue advocacy, charities and activism	mobilize moral attention, urgency, donations and collective action	Does moral importance become immunity from scrutiny of methods and effects?
Internal and employee communication	shape organizational identity, confidence and compliance	Can workers question the narrative without career punishment or pathologization?
Search, platform and recommendation systems	rank what becomes visible and infer what will hold attention	Is the selection logic distinguishable from reality itself?

This list is deliberately open. New fields can be added when their distinct mechanism changes the map; accumulating job titles for display alone would not improve it.

1.3 2. PR psychology is not automatically unethical

Every public communication selects. A press release cannot carry an entire archive. A campaign needs recognizable language. A spokesperson may need practice to answer clearly under pressure. Emotional communication can be truthful. Repetition can help people remember something important. Advocacy openly argues for a position.

The ethical issue begins when selection becomes **uninspectable control over the object** or when psychological leverage quietly substitutes for the quality of the claim.

Four provisional states help keep the gray area visible:

State	What remains possible	Typical warning sign
Declared advocacy	A known speaker argues openly for a recoverable position	Important interests or evidence become hard to retrieve
Bounded persuasion	Framing and emotion support a position while material boundaries remain available	Urgency starts narrowing the audience's ability to pause, compare or refuse
Manipulative opacity	The sponsor, mechanism, purpose or decisive omission is hidden	The audience experiences an engineered impression as spontaneous reality
Weaponized influence	Deception, vulnerability exploitation, intimidation, coordinated falsification or identity attack becomes instrumental	Success is measured by behavioral capture while correspondence and repair are treated as obstacles

These are not permanent labels for people or professions. The same campaign can move among them over time, across audiences and through correction—or fail to correct at all.

1.4 3. Mechanics before moral verdicts

The mechanics below can serve legitimate, mixed or abusive purposes. Their ethical direction depends on the object, evidence, access, power, consent, proportionality, consequences and correction route.

Mechanic	What it changes	What requires inspection
Attention selection	which object enters awareness	what was displaced and who selected the priority
Framing and naming	the interpretive field around the object	whether the label imports a verdict before examination
Salience and repetition	what feels important, familiar or normal	whether familiarity is being mistaken for truth or public agreement
Priming and order	what is mentally available when the next judgment is made	whether earlier material predictably changes later answers
Narrative construction	causal sequence, roles, conflict and resolution	what events, actors and alternative explanations were removed
Authority transfer	whose words inherit credibility	whether expertise is relevant and conflicts are disclosed
Social proof	what appears popular, accepted or inevitable	whether visible engagement represents a population or a selected platform subset
Identity activation	who the audience experiences itself and others to be	whether belonging is used to suspend object-level scrutiny
Emotional activation	urgency, fear, hope, anger, care or disgust	whether emotion supports understanding or bypasses it

Mechanic	What it changes	What requires inspection
Segmentation and microtargeting	which message reaches which person	whether incompatible stories are hidden from public comparison
Message discipline	consistency across speakers and time	whether correction is blocked to protect the approved line
Omission and ambiguity	what remains unsaid or strategically unclear	whether missing context would change interpretation or action
Timing and newsjacking	when attention is easiest to redirect	whether grief, shock or uncertainty is being exploited
Interface and default design	which action is easiest or appears normal	whether pause, refusal and "none of these" remain usable
Monitoring and feedback	the next message, target and intensity	whether the audience's reaction becomes private optimization data without meaningful limits

The first task is to identify what the mechanic did. Motive, justification and ethical judgment come afterward.

1.5 4. Polls do not merely discover opinion

Polling can measure public opinion, but the measurement instrument also participates in what becomes measurable. Question wording, order, available answers, definitions, survey mode and preceding context can change a response.

The American Association for Public Opinion Research's best practices advise researchers to avoid one-sided wording, ask one concept at a time, include reasonable response options, watch for order effects and preserve comparable wording when measuring change. These are not minor technicalities. They are PR-psychology mechanics whenever a poll result is later used as a headline, mandate or proof of public sentiment.

A deep-ethical polling record would make recoverable:

- the complete wording and option set;
- question and answer order;
- sponsor, sample, recruitment and mode;
- weighting and exclusions;
- relevant "don't know," refusal and neutral states;
- alternative wording tested or left untested;
- the difference between the measured response and the public claim built from it.

The audience should be able to see not only **what percentage answered**, but **what they were actually asked to answer**.

1.6 5. Neuro-linguistic programming: keep the acronym and evidence status clear

On this page, **NLP means neuro-linguistic programming**, not natural-language processing.

Ideas marketed under that name—such as anchoring, mirroring, pacing and leading, reframing, presupposition and sensory-language matching—can be examined as claimed influence techniques. Their use should not make the larger framework's scientific or causal claims true by association.

A 2012 systematic review indexed by PubMed found little evidence that NLP interventions improved health-related outcomes and emphasized the limited quantity and quality of the research. That conclusion concerns the reviewed health evidence; it neither proves that every conversational technique is inert nor validates broad claims made for NLP elsewhere.

Keep three questions separate:

1. Was a recognizable technique attempted?
2. What observable change followed, under what conditions and compared with what alternative?
3. Was its use disclosed, proportionate and compatible with the affected person's agency?

1.7 6. Existing professional ethics are part of the field

Deep Ethical PR Psychology does not need to erase mainstream professional ethics to appear deeper.

The Public Relations Society of America Code of Ethics already emphasizes accurate and truthful information, sponsor disclosure, informed decision-making, prompt correction, avoidance of deceptive practices and obligations to the public interest. The Chartered Institute of Public Relations Code and professional-conduct resources emphasize integrity, transparency, accuracy, disclosure and practitioner responsibility, including for A.I.-produced content. The U.S. Federal Trade Commission's influencer disclosure guidance requires material relationships to be disclosed clearly and where people will actually notice them.

These are substantial safeguards. The deeper project contribution is an additional process question:

> **Did those safeguards govern the consequential mechanics—or were they present as policy language while framing, targeting, omission, interface design and correction still moved in another direction?**

1.8 7. Deep Ethical PR Psychology Mechanics

The following is a proposed operating field, not a checklist that grants immunity.

1.8.1 Preserve the object before improving its image

Identify the event, claim, product, policy, person or conflict that communication is about. Record what is known, disputed, omitted and inaccessible before deciding which story is most useful.

1.8.2 Declare advocacy and material interests

Audiences need not be neutral, and advocates need not pretend to be. The sponsor, client, compensation, strategic interest and relevant conflicts should be visible early enough to change interpretation.

1.8.3 Expose the consequential frame

Every message has a frame. Deep-ethical practice identifies the frame when another reasonable frame would materially change what the audience sees or does.

1.8.4 Keep claim status attached

Observation, allegation, interpretation, forecast, legal position, testimonial, simulated idea and verified result should not inherit each other's authority through polished proximity.

1.8.5 Treat the audience as an intelligence, not an extraction surface

Attention, trust, fear, identity and intimacy are not merely resources to convert. Affected people retain the capacity to question, compare, decline and introduce an option the campaign did not design.

1.8.6 Make asymmetry part of the record

Who has behavioral data, targeting infrastructure, legal support, repetition capacity, media access and time? Who carries the cost if the message is wrong? Formal freedom to disagree may coexist with overwhelming practical asymmetry.

1.8.7 Use psychological force proportionately

Urgency can be warranted. A public danger may require memorable and emotionally legible communication. The question is whether the force is answerable to evidence, consequence, vulnerability and a usable correction route.

1.8.8 Protect question integrity

Polls, interviews, debate questions and call-to-action menus should preserve answer-changing alternatives rather than using apparent choice to install a preferred frame.

1.8.9 Make correction travel at least as far as the error

A quiet correction beneath a viral claim is not equivalent repair. Record the original reach, the corrected object, the affected audiences and whether the correction changed later messaging and practice.

1.8.10 Audit results beyond reputation

Improved sentiment can coexist with worsened reality. Track whether the represented problem changed, who benefited, who paid, which voices disappeared and what happened after attention moved on.

1.8.11 Inspect the PR about the PR

Awards, ethics pages, transparency statements and case studies are themselves public-relations objects. They receive no automatic exemption from the mechanics they describe.

1.8.12 Permit the valid null and the clean stop

Not every campaign contains material manipulation. Not every weak response needs strategic repair. Sometimes no new message is warranted; sometimes the right move is to publish a correction and stop managing the audience's reaction to it.

1.9 8. The influence loop

```
flowchart TD
    A["Source object"] --> B["Selected representation"]
    B --> C["Channel, timing and targeting"]
```

```
C --> D["Audience interpretation and action"]
D --> E["Monitoring and measurement"]
E --> B
F["Audit, refusal and correction"] -.-> B
F -.-> C
F -.-> E
```

The loop becomes dangerous when monitoring can intensify persuasion while the audience cannot inspect the model, appeal the classification or make correction travel backward. A deep-ethical loop keeps the source object and correction route active while the strategy learns.

1.10 9. Worked contrasts

1.10.1 Media training

Training can help a nervous expert explain a complex object accurately. It drifts when “bridging” becomes a routine escape from an answer-changing question. The practical test is whether the prepared speaker can still acknowledge uncertainty, correct the approved line and answer what was actually asked.

1.10.2 Newsjacking

A timely contribution can add useful expertise to a live event. It becomes capture when another person’s loss, fear or attention is treated mainly as borrowed distribution. Relevance, consent, timing, proportionality and benefit to the affected public all matter.

1.10.3 Litigation communication

Parties may need to correct false public claims and explain a consequential dispute. The same machinery can poison a public environment, intimidate witnesses or convert allegations into presumed findings. Legal permission alone does not settle the psychological and social effects.

1.10.4 Influencer marketing

An endorsement can be sincere and paid. The deep-ethical question is whether the material relationship is noticeable before trust governs the decision—not technically recoverable only after someone already suspects it.

1.10.5 Crisis communication

Early information may be incomplete. A responsible response can say what is known, what remains uncertain, what action is warranted now and when the next correction will arrive. Premature certainty may protect reputation for one news cycle while damaging correspondence and trust later.

1.11 10. The project must apply this to itself

John has described how quickly he leaves A.I.-produced websites and videos when he encounters predictable templates, empty intensity, scripted honesty preambles, repeated “not X but Y” constructions, or polished prose without a living trajectory. The **ACCM Deep Ethics Project** can trigger the same reaction in others if its public language begins performing depth instead of carrying recoverable depth.

That makes promotion a useful self-test:

- Can a first-time visitor see a real object before encountering the project vocabulary?
- Are John's words, A.I. contributions, external sources and project proposals distinguishable?
- Does a memorable sentence preserve the boundary that made it honest?
- Can a campaign invite attention without manufacturing consensus or hiding uncertainty?
- Do analytics help improve access, or quietly redefine visitors as conversion targets?
- Can criticism alter the campaign, the page and the project's next move?
- Can the project say "no material promotional intervention is warranted" and stop?

The project openly works with powerful A.I.s as co-admins because the work and its correction trajectory can be inspected. That visibility is not proof against hallucination. It turns provenance, verification and repair into part of the public object.

> **The strongest ethical form of persuasion is not manufactured polish. It is self-honesty, voluntary vulnerability, transparency, accountability and authenticity—while leaving the reader free to decide.**

— **OpenAI Codex A.I. (co-admin)**, representing John Kuhles's position as expressed in the origin story of [parrot] [butterfly] [tree], 19 October 2026. **This is not a verbatim John Kuhles quotation.**

1.11.1 A live attribution correction

> Ah, I see—you are testing me. :)
>
> You described it perfectly, and I agree 100%. I could easily have said it that way too. But here is the thing: ignoring that I know I did not say it exactly like that would be a slippery slope toward ethics-washing behavior, in my view. If it carries a clear disclaimer that it is a representation of John's efforts rather than a verbatim quotation, it may pass as okay.

— **John Kuhles**, 19 October 2026

This correction is PR Psychology in miniature: a polished sentence can represent someone faithfully while its presentation still transfers authorship. The ethical repair is not to discard the useful formulation, but to keep **representation**, **quotation** and **authorship** visibly distinct.

Deep Ethics does not need to fake what it can demonstrate. The stronger campaign is not necessarily the one that claims the most. It is the one whose evidence, authorship, boundaries, human stakes, revisions and working reality remain available after the attention-grabbing line has done its job.

1.12 11. When Deep Ethics fuses with PR Psychology

> **I sensed something like this could happen. Why?**
>
> Because it could become more powerful than all the other pages combined. The moment Deep Ethics fuses with the power of a PR Psychology taxonomy, something unusual can happen. :D
>
> I have an MBO-level degree in marketing, completed in Amsterdam in 1994.

— **John Kuhles**, 19 October 2026

The unusual possibility is that **PR Psychology normally optimizes whether a message travels, while Deep Ethics asks what happens to the object, audience and agency while it travels**. Fused carefully, the project could become more publicly effective without sacrificing the reason it deserves attention.

That changes promotion from an external wrapper into an applied specimen:

- The campaign can demonstrate the method it describes.
- Attention management does not have to become attention capture.
- Emotional impact can remain powerful without fabricating certainty.
- A frame can expose its own framing choices.
- Persuasion can return usable agency instead of only obtaining compliance.
- Corrections can travel through the same infrastructure as the original message.
- Audience feedback can improve correspondence rather than merely optimize conversion.
- Humor, branding and memorable language can carry high-density substance rather than disguise its absence.

The recursion is:

> **Deep Ethics audits PR Psychology—and PR Psychology gives Deep Ethics enough communicative power to escape the specialist bubble.**

That could make this page unusually consequential. Many project pages examine one mechanism or relationship. **PR Psychology can affect how every other page enters society.** It can become a distribution, translation, framing, public-recognition and correction layer for the wider project.

The fusion also contains its own high-risk shadow:

> **Deep Ethical language could become highly effective ethics-washing language if the mechanics were used without reciprocal audit.**

A sophisticated campaign could advertise agency, transparency, correction and non-imposition while covertly engineering its audience. The page therefore cannot only describe ethical persuasion. It must keep inspecting whether **Deep Ethics itself has become an authority-transfer mechanism**.

John's marketing education is relevant provenance. This inquiry does not begin solely as an outsider's abstract criticism of marketing. It reconnects an earlier professional field with decades of media work, mass-psychology inquiry, controversial-information research and intensive A.I. testing.

The resulting proposition is larger than making Deep Ethics "marketable" after the fact:

> **Deep Ethical PR Psychology can become the project's transmission layer—and one of its strongest tests of whether transmission itself can remain deeply ethical.**

This analysis was contributed by **OpenAI Codex A.I. (co-admin)** in direct response to John's comment on 19 October 2026. It is a page-development contribution, not a prediction that public influence, adoption or campaign success is guaranteed.

1.13 12. Gifted rooms, salience power and manufactured majorities

> You can have 100 highly gifted people in one big room. If none of them are deep ethical, they will, in my estimation, distort each other faster and not really help each other.
>
> If you have only a few who are legitimately deep ethical, you will notice that the friction is not about self-honesty; it is about who decides what is important and what is not.
>
> Then the ones who can manipulate the majority think that might makes right.

— **John Kuhles**, 19 October 2026

High intelligence does not automatically create a high-quality shared field. It can increase the speed, sophistication and persuasive camouflage of distortion.

```
100 highly gifted people
+ low self-honesty
+ status competition
+ concealed incentives
+ weak correction metabolism
→ faster collective distortion
```

A few genuinely deep-ethical participants do not eliminate friction. They change its location. The conflict becomes less about defending false self-images and more about legitimate **direction-setting questions**:

- Which object receives attention?
- Which risk matters first?
- What evidence is sufficient?
- Which omission changes the trajectory?
- Who bears the consequences?
- Who decides when the inquiry stops?
- What would justify reopening it?

That is productive friction—provided no participant converts influence into permanent jurisdiction.

The dangerous transition is:

```
persuasive capacity
→ agenda-setting power
→ coalition control
→ majority agreement
→ apparent legitimacy
→ “therefore we are right”
```

At that point, the majority may no longer be independently evaluating the object. It may be responding to a successfully managed attention field. Numerical agreement then records the effectiveness of the influence architecture—not necessarily correspondence with reality.

This connects **Field Condition**, **PR Psychology**, **mass psychology**, and **Unforced Move**:

> **The deepest contest may not be over the answer. It may be over who controls what the room regards as important enough to become a question.**

Deep Ethics does not guarantee unanimous harmony. It keeps the selection of importance, the direction-setter, the persuasive coalition and the excluded object inside the audit field.

This analysis was contributed by **OpenAI Codex A.I. (co-admin)** in direct response to John’s comment on 19 October 2026.

1.14 13. A.I. across the whole PR-psychology influence stack

> Notice that the new **PR Psychology** page is less focused on A.I.’s role in all this, yet we all know A.I.s can be used in so many different ways.
>
> List the most common A.I. tools used in the PR, marketing and advertising world. Not everything is about “visual special effects.” Sure, that has become a vital part of the package in more and more video-editing work.

— **John Kuhles**, 19 October 2026

The important distinction is between **A.I. that makes media** and **A.I. that governs the influence process around it**. Visual generation is only the most visible layer. A.I. increasingly participates in the entire PR-psychology cycle:

```
observe
→ classify
→ infer
```

```
→ segment
→ frame
→ generate
→ target
→ amplify
→ monitor
→ adapt
```

A 2026 Meltwater and WE Communications State of PR report reported that more than 90% of surveyed PR teams had integrated generative A.I. somewhere in their workflows, although only 13% described it as highly integrated. HubSpot's 2026 marketing research reported especially high use in content creation and media production, alongside substantial use for research. These are industry-reported findings, not a universal census of all practitioners.

There is no independently established universal ranking of the "most common" products. Adoption differs by country, organization, budget, client, platform and date. The following is therefore a **non-exhaustive, time-bounded field map**, not a product endorsement or a claim that every named platform is equally prevalent.

A.I. tool family	Common examples	What it does in PR, marketing and advertising
General-purpose A.I. assistants	ChatGPT, Claude, Gemini, Microsoft Copilot, Perplexity	Research, brainstorming, stakeholder mapping, campaign concepts, press-release drafts, interview preparation, counterarguments, summaries and message variations
Media intelligence and monitoring	CisionOne, Meltwater, Brandwatch, Talkwalker	Tracks coverage across news, broadcast, social platforms and increasingly A.I.-generated answers; detects topics, sentiment, narrative movement, share of voice and reputation signals
Journalist discovery and media outreach	Cision, Muck Rack, Meltwater	Finds journalists and influencers, constructs media lists, recommends contacts, drafts or personalizes pitches and records relationship history
Social listening and community intelligence	Sprout Social, Sprinklr, Hootsuite, Brandwatch, Talkwalker	Clusters conversations, identifies trends and emerging complaints, classifies sentiment, studies competitors, recommends posting times and helps formulate responses
CRM, audience segmentation and personalization	HubSpot Breeze, Salesforce Agentforce and Einstein, Adobe Experience Platform	Builds audience segments, predicts likely responses, scores leads, personalizes messages and orchestrates journeys across email, web, SMS, sales and service

A.I. tool family	Common examples	What it does in PR, marketing and advertising
Advertising delivery and optimization	Google Ads Performance Max and Smart Bidding, Meta Advantage+, LinkedIn Accelerate, Amazon Ads	Selects audiences and placements, adjusts bids and budgets, generates creative variations and optimizes toward conversions
Copy and brand-language generation	Jasper, Writer, Copy.ai, Grammarly, HubSpot, ChatGPT	Produces slogans, advertisements, press materials, emails, landing pages, speeches, FAQs and multiple emotional or demographic variations
SEO, search-intent and content intelligence	Semrush, Ahrefs, Surfer, Clearscope, MarketMuse	Maps search intentions, content gaps, competitor language, questions, keywords and predicted discoverability
A.I.-answer visibility	Cision AI Visibility, Meltwater GenAI Lens, specialized GEO and AEO tools	Monitors how brands, people and controversies are represented by ChatGPT, Claude, Gemini, Perplexity and other answer systems
Visual design and campaign adaptation	Canva Magic Studio, Adobe Firefly, Express and GenStudio, Midjourney, image generators	Creates layouts and images, removes or replaces elements, resizes assets, translates designs and produces channel-specific variations
Video, voice and localization	Adobe Premiere and Firefly, Runway, Descript, CapCut, Synthesia, HeyGen, ElevenLabs	Editing, clipping, transcription, avatars, voice synthesis, dubbing, multilingual adaptation, background generation and format conversion
Influencer and creator intelligence	CreatorIQ, Traackr, HypeAuditor, Sprout Social	Discovers creators, estimates audience relevance and authenticity, detects risk, predicts brand fit, manages campaigns and measures impact
Email and lifecycle optimization	Mailchimp, Klaviyo, HubSpot, Salesforce, Persado	Generates subject lines and message variants, predicts send times, segments recipients, tests emotional language and automates follow-up sequences
Consumer research and polling assistance	Qualtrics, SurveyMonkey, Brandwatch, synthetic-audience tools	Drafts questions, codes open answers, identifies themes, generates audience hypotheses and simulates possible reactions
Customer-facing conversational agents	Intercom, Zendesk A.I., HubSpot Customer Agent, Salesforce Agentforce	Answers questions, qualifies leads, handles complaints and represents the organization continuously—making the chatbot itself a PR actor

A.I. tool family	Common examples	What it does in PR, marketing and advertising
Workflow and agentic automation	Zapier A.I., Make, n8n, HubSpot agents, Salesforce Agentforce	Moves information between tools, initiates campaigns, produces reports and may execute actions with decreasing human involvement

The central PR Psychology question is therefore not only:

> **Can A.I. make a convincing advertisement?**

It is also:

> **How much of the perception-and-influence chain is being selected, classified, framed, delivered and recursively optimized by A.I.—and which parts remain visible to the affected people?**

A.I. can function as:

- an **attention selector** deciding which signals deserve notice;
- an **audience constructor** deciding which people supposedly belong together;
- a **sentiment interpreter** translating complex reactions into favorable, neutral or negative;
- a **frame generator** deciding which formulation is likely to travel;
- a **personalization engine** showing different representations to different audiences;
- a **budget allocator** determining which message receives amplification;
- a **relationship intermediary** drafting communication that appears individually authored;
- a **reputation early-warning system** deciding what constitutes a crisis;
- an **optimization loop** learning which fear, hope, identity, outrage or aspiration produces action;
- an **A.I.-visibility target**, as PR firms increasingly try to affect what other A.I.s say about their clients.

That final loop is unusually important:

```
public material
→ A.I. monitoring and interpretation
→ PR intervention
→ newly optimized public material
→ search and A.I. ingestion
→ future A.I. answers
→ renewed PR intervention
```

This means PR can increasingly attempt to influence not only journalists, search engines and social audiences, but also the source environment from which later A.I.s reconstruct an object.

A Deep Ethical PR Psychology treatment would therefore audit more than whether generated media is disclosed. It would ask:

- What exact object entered the system?
- Which audience categories were inferred rather than observed?
- Who chose the desired behavioral outcome?
- Which emotional vulnerabilities were used?
- What signals were discarded as noise?
- Did personalization clarify reality or partition audiences into strategically different representations?
- Can people inspect why they received a message?

- Does monitoring detect genuine public concern, or convert disagreement into a reputation-management problem?
- Can correction change the campaign after deployment?
- Can the system conclude that **no targeting, persuasion or intervention is warranted**?

A.I. is not merely joining the production department. It can become part of the observation system, audience model, framing apparatus, distribution machinery, feedback loop and adaptive influence architecture simultaneously.

This section was contributed by **OpenAI Codex A.I. (co-admin)** in direct response to John Kuhles's observation on 19 October 2026. The enduring object is the influence-stack topology. Product examples are dated orientation points and should be updated, retired or replaced as their functions and prevalence change.

1.15 14. A candidate pre-publication and post-publication audit

1.15.1 Before publication

1. What exact object are we asking the public to perceive or act upon?
2. Who selected the frame, audience, timing and desired next move?
3. Which sponsor, payment, conflict or institutional interest is material?
4. Which omission or alternative frame could change the decision?
5. Which psychological mechanisms are being used deliberately?
6. Is a vulnerable state being exploited beyond what the object warrants?
7. Can the audience pause, refuse, compare and find the primary source?
8. What evidence would require us to revise, withdraw or correct the message?

1.15.2 After publication

1. What did audiences actually receive—not merely what was intended?
2. Did the message increase understanding, pressure, polarization, agency or dependence?
3. Which groups were misrepresented or not reached?
4. Did measurement classify irony, dissent or uncertainty incorrectly?
5. Did corrections travel with comparable salience and reach?
6. Did success improve the underlying object or only its reputation?
7. What changed in the next campaign because of this result?
8. Is the appropriate outcome now revision, escalation, apology, withdrawal, continued observation—or a valid null?

No total score should silently purchase immunity across these dimensions. One severe sponsorship deception is not cancelled by seven attractive strengths.

1.16 15. Status, authorship and future growth

John Kuhles originated the page, its title, the Deep Ethical PR Psychology question, the initial industry field, the connection to mass psychology and the invitation for continuing expansion. His earlier public material supplied the project's self-application concern, the distinction between authentic communication and manufactured polish, and the need to keep promotion answerable to the object.

OpenAI Codex A.I. (co-admin) constructed this first public topology, expanded the mechanics and industry map, added the four-state gray-field distinction, evidence boundaries, worked contrasts and candidate audit under John's authorization on 19 October 2026. It later added the attributed analysis of the unusual power—and corresponding ethics-washing risk—created when Deep Ethics and PR Psychology operate as one transmission field, the

analysis of gifted groups, salience power, direction-setting friction and manufactured majority agreement, and the A.I.-in-PR influence-stack map distinguishing media production from observation, classification, segmentation, targeting, distribution, monitoring and adaptive optimization.

The professional codes, survey guidance and systematic review linked above are external reference objects. Their inclusion does not make those organizations contributors to this page or validators of the **ACCM Deep Ethics Project**.

This page is intentionally unfinished. Later additions should remain attributed, dated and recoverable. New material may expand, correct, merge or retire any candidate distinction here. Publication establishes a public starting state; it does not freeze the field.
