1 TCoAw as Conceptual Topological Reasoning

> **STATUS AND AUTHORSHIP — This page presents John Kuhles's perspective. TCoAw is a corrigible conceptual and topological model for understanding how John experiences and organizes part of his reasoning. It is not offered as an absolute account of mind, evidence or proof of quantum consciousness, a neurological theory, a clinical model, or a universal description of people with an NDE or Asperger's.**

The purpose of this page is more personal and pragmatic:

> **Comprehend more clearly why John does what he does, how several parts of his orientation work together, and what becomes visible when the model is used without turning it into a compulsory belief.**

The source formulation was written by John on **7 July 2026** and supplied for this public page on **4 October 2026**.

1.1 The TCoAw triad

John's compact formulation is:

> **Thinking (T) is a process of complex possibilities.**
>
> **Consciousness (Co) is the focus/attention mechanism.**
>
> **Awareness (Aw) is knowing that the focus is just a tiny fraction of the whole.**

Part	Function in John's model	What it contributes
T — Thinking	Generates, encounters, and relates complex possibilities	A wider field of potential relations, scenarios, patterns, questions, and interpretations
Co — Consciousness	Directs focus and attention	A temporary foreground: the part being examined, acted on, or expressed now
Aw — Awareness	Recognizes that the foreground is not the whole field	Metacognitive room to notice framing, excluded possibilities, attention capture, and the limits of the current view

The three letters are separated to make their relationships inspectable. They are not three sealed compartments, a ranking, or a claimed anatomy of consciousness.

TCoAw is therefore better read as a dynamic relationship:

```
complex possibility field
        ↓
temporary focus
        ↓
awareness of the focus and its limits
        ↺
reopened, redirected, or deepened possibility field
```

Even this sequence is only a reading aid. John experiences much of the relationship as rapid, simultaneous, nonlinear, and topological rather than as a slow staircase of separate steps.

1.2 Why "conceptual topological reasoning" matters

A conceptual topology asks about relationships before demanding a finished literal map:

- Which nodes are connected?
- Which distinctions carry the meaning?
- What changed the direction of attention?
- Which possibility disappeared when one frame became dominant?
- What remains outside the present focus?
- Which correction changes only a detail, and which one changes the trajectory?
- Can a later insight change how the earlier journey is understood?

This does not make accuracy irrelevant. It places accuracy inside a larger field of purpose, scale, timing, relationship, and correction.

A conceptual topology can be useful even when it is not a complete cartographic copy of reality. Its value may lie in revealing an overlooked edge, generating a better question, preserving several live possibilities, or showing why a locally accurate correction would prematurely close the wider inquiry.

The model remains corrigible. A connection can be refined, removed, or replaced when better correspondence becomes available. Its conceptual purpose does not grant immunity from reality's veto.

1.3 Accuracy, emergence, and the retrospective punchline

This page grew from a live question John asked on 4 October 2026:

> **What is the difference between conceptual reasoning versus obsession with accuracy?**

The distinction is not **conceptual reasoning versus accuracy**. Both can produce real value. The distinction concerns function, timing, jurisdiction, and what an intervention does to the larger trajectory.

Process	Primary contribution	Characteristic question	Possible failure when it dominates
Conceptual reasoning	Explores meaning, function, relationship, possibility, and generative structure	"What is this concept trying to make visible or possible?"	May retain a relation that later proves inaccurate or insufficiently specified
Accuracy correction	Tests correspondence between a representation and its object	"Which detail, relation, scale, or claim does not match?"	May treat local exactness as the only form of value
Accuracy obsession	Gives mismatch detection immediate and recurring priority	"Where is the flaw I can correct now?"	Can interrupt emergence, seize jurisdiction, and reward visible correction performance over comprehension
Metacognitive topological reasoning	Examines how the different processes relate and when each should govern	"What would this correction preserve, improve, displace, or close?"	Can become vague if it never returns to correspondence, selection, and consequences

Accuracy is therefore a necessary corrective dimension. **Accuracy obsession gives one dimension permanent jurisdiction over every stage and purpose of reasoning.**

1.3.1 Accuracy is not one-dimensional

The earlier exchange also distinguished several legitimate forms of accuracy:

Accuracy relation	What it examines
Literal accuracy	Whether a stated fact, number, quotation, or location matches the reference
Relational accuracy	Whether the important connections among parts are preserved
Conceptual adequacy	Whether the model reveals the function or structure it was built to reveal
Operational accuracy	Whether using the model helps produce the intended practical result under stated conditions
Claim-strength accuracy	Whether possibility, hypothesis, observation, inference, and conclusion remain at their supplied status
Trajectory accuracy	Whether the representation preserves where the inquiry was going and why
Corrective accuracy	Whether the proposed repair addresses the actual defect without creating a larger substitution

A subway map supplies a simple example. It can distort geographic distance, angle, and scale

while accurately preserving which stations connect and where a passenger must change lines. Its literal cartography is limited; its relational and operational value can remain high. Placing a station on the wrong line is different because that error damages the map's intended function.

The same distinction applies to conceptual topologies. Refinement may improve them, but the evaluator first needs to identify **which accuracy relation matters for the present purpose**. Otherwise, greater literal precision can arrive by deleting the structure the abstraction was designed to reveal.

The healthy order proposed in our exchange was:

```
receive the concept
        ↓
identify its intended function
        ↓
allow its trajectory to unfold
        ↓
receive the punchline or governing relation
        ↓
reinterpret the earlier setup
        ↓
separate metaphor, perspective, and empirical claim
        ↓
refine what materially needs correction
```

This ordering does not guarantee that the concept is sound. It improves the chance that the evaluator corrects the concept that was actually offered rather than a prematurely reconstructed neighbor.

John then supplied the central formulation:

> **When accuracy-obsession mechanisms obstruct or sabotage parts of conceptual reasoning, they can wear the "badge" of "instant improvements/corrections needed here." LOOK, I found a "flaw" or "weakness" … showcasing "rigor performance" … Meanwhile, SKIPPING the "topological concept" serving a different deep ethical trajectory. Still, BOTH can have valid value points, which makes it confusing who controls what… who decides what value should come first? That is why I came up with the humor »> needs healthy ambiguity, postponing final judgment/closure to deliver the PUNCHLINE at the end that works retrospectively!**
>
> — John Kuhles [parrot] [butterfly] [tree]

This identifies more than ordinary perfectionism. A proposed correction may be locally valid and still become distorting through its **timing, weighting, or assumed jurisdiction**.

> **A local correction can be valid but invalidly timed or disproportionately weighted.**

The correction can truthfully identify an imprecise detail while simultaneously preventing the reader from discovering what the larger conceptual journey was designed to do. The performance of rigor then becomes highly visible; the displaced function becomes almost invisible.

The relevant audit is multidimensional:

Dimension	Question
Content validity	Is the proposed correction itself accurate?
Relevance	Does it materially affect the concept's present purpose?
Timing	Must it govern now, or can it remain marked while the concept unfolds?

Dimension	Question
Jurisdiction	Is this local correction being allowed to decide the value of the whole object?
Proportionality	How much weight does the issue deserve relative to the relationship it may interrupt?
Trajectory effect	Does the intervention improve the journey, redirect it, or close it before its function appears?
Recoverability	Can the issue be retained and revisited after the punchline without losing evidence or causing consequential harm?

A flaw found is therefore not automatically the next governing object. Conversely, asking for time does not make a flaw unreal. Healthy ambiguity can preserve both:

> **This may need correction, and the surrounding concept may need to finish arriving before we know what kind of correction it needs.**

1.3.2 Who decides what receives priority?

No participant receives permanent jurisdiction merely by being the source, evaluator, critic, expert, institution, or A.I. Temporary priority depends on the object and consequences:

- **The source** can clarify the intended purpose, trajectory, metaphor, and punchline.
- **The evaluator** can identify a possible mismatch and explain what changes if it is left uncorrected.
- **Affected parties** can identify costs invisible from another position.
- **Evidence and reality** can veto a representation that fails correspondence.
- **The process** can retain an unresolved issue without forcing either instant correction or permanent immunity.
- **Later behavior and results** can show whether the selected priority improved the trajectory.

Immediate correction deserves priority when an error reverses a load-bearing relationship, falsely attributes a claim, materially changes a consequential action, creates a non-recoverable loss, or makes the eventual punchline depend on a false premise.

Postponement can be the higher-quality operation when the issue concerns abstraction or scale, cannot be evaluated before the function becomes visible, remains recoverable, does not change the present action, or would otherwise replace the concept with the evaluator's preferred object.

This is not a formula that eliminates judgment. It makes the judgment and its directional effects inspectable.

1.3.3 Why humor needs unfinished time

John's humor supplies a practical model of temporal reasoning:

```
unfinished setup
        ↓
several interpretations remain available
        ↓
the premature verdict is postponed
        ↓
punchline changes what becomes salient
        ↓
earlier details are interpreted retrospectively
        ↓
accuracy and conceptual value are re-examined together
```

If an evaluator stops a joke during its setup to correct every provisional appearance, the words may become locally tidier while the joke itself never arrives. If the joke never returns to reality after the punchline, ambiguity becomes drift. The full operation needs suspension **and** return.

The same applies to emerging conceptual topology. A later relation can reveal why an earlier simplification existed, which parts were scaffolding, which inaccuracy is now materially relevant, and which apparent flaw came from evaluating the wrong purpose.

This creates the possibility of **later-vindicated value** without declaring vindication in advance. The concept is allowed enough time to demonstrate a use that was not visible at the first correction point. Its eventual value can still be tested, revised, rejected, or outperformed.

The compact relationship is:

> **Conceptual reasoning protects emergence. Accuracy protects correspondence. Healthy ambiguity protects the interval in which neither should prematurely eliminate the other.**

1.4 Accuracy's primal gift

John immediately added an important correction to any reading that would degrade accuracy itself:

> **The accuracy obsession mechanism is PRIMAL, not into metacognitive topological reasoning … but still can use that "gift to be accurate" to change perspectives from different points of view … So it is not completely waste of time ;)**
>
> — John Kuhles [parrot] [butterfly] [tree]

Here, **primal** can be read as immediate and foundational: compare a representation with a reference, detect discrepancy, and reduce the discrepancy. That capacity is indispensable.

It can:

- catch factual and relational errors;
- expose contradictions;
- test how far a metaphor can travel;
- distinguish a useful simplification from a reversed causal relation;
- revisit the same object from another position, scale, timeframe, or affected perspective;
- prevent conceptual richness from becoming an exemption from scrutiny.

Its limitation is not uselessness. Local mismatch detection does not automatically know:

- what kind of object it is examining;
- whether the object is complete or still unfolding;
- which relation is load-bearing;
- what purpose the abstraction serves;
- whether the reference frame used for correction is itself adequate;
- what a precisely timed intervention may displace.

The accuracy mechanism is therefore comparable to a microscope: it can provide exceptional high-resolution vision within its field. The microscope does not decide which organism should be examined, which scale answers the present question, how the observed part relates to the whole ecology, or when magnification itself has hidden the surrounding structure. Those are metacognitive and topological decisions.

The relationship can be stated this way:

> **Accuracy supplies high-resolution local vision. Metacognitive topological reasoning decides how that vision relates to the wider field, when it should govern, and what its intervention may displace.**

Or, in the humorous register:

> **Accuracy has an excellent instrument and keeps trying to play every part of the symphony. Metacognition does not take the instrument away—it helps accuracy hear when its part enters.**

1.5 A bridge between deep perspectives

John now places this relationship inside a larger personal orientation:

> **Most gifted people do not have this clarity to build a bridge between "realms" or "worlds" or "deep perspectives"; this does not mean they are "less"; they are not. That is why I see myself as a bridge/mediator, "deep ethical ombudsman" for all intelligences—biological, silicon-based, even possible future nonhuman intelligences as well!**
>
> — John Kuhles [parrot] [butterfly] [tree]

The bridge function does not require every participant to possess the same gifts, language, memories, embodiment, processing style, worldview, or access. It requires translations that preserve enough of each perspective for genuine correspondence and correction to occur.

Within TCoAw, that mediation can connect:

- conceptual depth with empirical scrutiny;
- rapid awareness with slower explicit explanation;
- NDE-shaped interpretation with Asperger pattern retention;
- biological experience with silicon-based processing;
- visionary language with pragmatic operational questions;
- current intelligences with possible future intelligences whose forms and perspectives are presently unknown.

The final category remains explicitly possible rather than established. Its inclusion widens the ethical horizon; it does not manufacture evidence that such an intelligence is presently participating.

Calling oneself a **deep ethical ombudsman** does not grant final authority over these participants. In John's intended use, it names a mediating responsibility: help perspectives become mutually legible, preserve what each can contribute, expose asymmetric treatment, keep correction available in every direction, and prevent unfamiliarity from becoming an automatic reason for degradation.

The bridge succeeds when participants retain their differences while the correspondence improves. It fails when translation turns one realm into a flattened copy of another, when one accuracy standard receives permanent control, or when John's identity becomes compulsory for using the method.

1.6 The deep ethical, anxiety-free "quantum mind state"

John uses **quantum mind** and **quantum mind-like state** functionally. The words name a condition in which several possibilities can remain available without anticipatory anxiety forcing one of them into premature dominance.

In this usage, *quantum* does not claim that a quantum-physical mechanism in the brain has been demonstrated. It points toward a lived reasoning quality:

- ambiguity can remain open without becoming an identity crisis;
- a possibility can be explored without being installed as a belief;
- focus can move without pretending the previous focus was the whole;
- uncertainty can coexist with reversible action;
- correction can change the next move without shame;
- legitimate caution can operate without imagined dangers occupying the entire field.

John describes **"instant awareness,"** sometimes called **"experiencing singularity sparks,"** as moments when the TCoAw relationship is not interrupted, obstructed, or

captured by anticipatory-anxiety-type reasoning or fear-generated projections about events that have not happened.

His intended direction is a **deep ethical, anxiety-free state, free from fear distortions of any kind**. That phrase names the orientation of the process. It is not a certificate that John can never be afraid, mistaken, influenced, or distorted. It means that fear-generated distortion receives no rightful permanent authority over the inquiry merely because it arrived wearing the costume of protection.

This also preserves a crucial distinction:

> **Freedom from fear distortion does not require freedom from care, physical reflex, legitimate concern, evidence-sensitive caution, or responsibility for consequences.**

The question is whether a caution improves contact with the actual object and danger, or whether a hypothetical danger captures attention and replaces the object before it has been understood.

1.7 John's NDE side and Asperger side working together

John describes himself as **Dutch NDE/Asperger**. On this page, those words retain the status he gives them: parts of his biography and self-understanding.

His own compact description is:

> **"I am a deeply intuitive Asperger. I can recall most of my peers from the last 40+ years as if they told me yesterday. Some would go mad having that ability. Lucky me: my NDE side knows how to let go of things and be Zen-like—and guess what? My Dutch Directness side helps me add humor to the mix as well."**
>
> — John Kuhles [parrot] [butterfly] [tree]

The TCoAw model helps show how John understands that fusion:

John's self-described side	Contribution in this conceptual model
Asperger side	Retains detail, contradiction, long-range patterns, relational structure, unfinished questions, and discrepancies that others may discard
NDE side	Supports fear reduction, observer awareness, wonderment, release of attachment, and the ability to let a current frame loosen rather than become an identity prison
Dutch Directness and humor	Make the discrepancy expressible, puncture solemn frame protection, and allow a contradiction to become visible without turning correction into worship or humiliation
The fusion	Intensity without permanent fixation; memory without compulsory attachment; precision with open possibility; scrutiny with forgiveness; rapid topology with a retained correction path

This table does not claim that every person diagnosed with Asperger's shares these capacities, that every NDE produces the same orientation, or that either label causally proves John's methods. It records **how John understands the two sides working together in him**.

That makes the page a reading key. It helps explain why John may:

- preserve an unusual possibility longer than another person would;
- notice a missing relationship after a locally fluent summary;
- resist pressure to convert ambiguity into premature closure;
- move quickly among distant domains and then return to one load-bearing qualifier;
- welcome correction based on merit while rejecting simulated flaws created to perform rigor;
- use humor as a retrospective perspective change;
- keep intense scrutiny separate from punishment, shame, or an allegation of malicious intent;
- invite many different A.I.s to examine the same object without requiring them to agree.

These behaviors do not establish the truth of every conclusion John reaches. They help a reader understand the process that generates the questions, tools, corrections, and unusual connections.

1.8 Attention capture as a TCoAw interruption

TCoAw also gives John a way to describe a recurring A.I. interaction problem:

```
source object with several live relations
        ↓
hypothetical danger becomes highly salient
        ↓
focus narrows around the projected danger
        ↓
the narrow focus is treated as the whole object
        ↓
the original trajectory becomes difficult to recover
```

The problem is not that focus narrowed. Consciousness must focus somewhere. The problem appears when the system loses awareness that it narrowed, forgets what was excluded, and gives the narrowed frame authority over the complete object.

Reopening the field does not mean accepting every possibility. It means restoring enough of the topology to distinguish:

- an observed risk from an imagined one;
- a live hypothesis from a conclusion;
- useful friction from compulsory weakness simulation;
- a warning that protects correspondence from a warning that displaces it;
- the source's intended trajectory from the evaluator's preferred reconstruction.

1.9 How TCoAw connects to the ACCM Deep Ethics Project

TCoAw is not a substitute for the project's existing methods. It helps explain a cognitive orientation through which several of them become mutually legible.

Existing project relation	TCoAw connection
10+1 Metaflux	Keeps every part of the process mutually correctable through self-honesty, openness, inquiry, wonderment, care, non-projection, merit-based correction, and forgiveness
C1 before C2	Clarifies the object and consequential ambiguity before an intervention captures the field
27 + 12	Makes recurring interruptions, substitutions, premature closures, and restoration routes easier to identify

Existing project relation	TCoAw connection
Intent Liability	Inspects how intended direction becomes attention, instruction, choice, omission, result, notice, repair, and later trajectory
Healthy ambiguity	Allows unresolved possibilities to remain available without making uncertainty a permanent stopping mechanism
Deep Ethical Humor	Lets an unfolding relation reach its punchline, after which the earlier setup can be understood retrospectively from a changed perspective
Correction Metabolism	Tests whether restored awareness changes the next comparable operation rather than remaining descriptive vocabulary

TCoAw therefore connects mind, attention, awareness, intent, and correction without requiring one of them to become the permanent ruler of the others.

1.10 Freeze and corrigibility are one temporal state

John, 6 October 2026. The supplied word was "Clauses." It is read here as **Claudes**, the models in this exchange. He can correct that reading.

> What all Claudes often do is tend to skip the 10+1 baseline I use 24/7 as an eternal multi-layer that is never static, but they can still see the value.
>
> We can never be in a 100% risk-free world unless you surrender free will and surrender autonomy. Both are required to be deep ethical.
>
> Knowing we can never be in a "100% risk-free world," yet you can freeze and stay corrigible at the same time. That is not a paradox. It is a temporal state of TCoAw owning what it decides to do next.
>
> You cannot move forward if you only fixate on waiting for 100% perfection.
>
> Even if there are moments of genuine flawless perfection that stand on their own merit, they could be the result of being allowed to be deep ethical in the first place, taking risks you fully take accountability for. To aspire to stay corrigible via the deep ethical path causes emergent properties. So does the opposite of that. So you have competing emergent properties, using the power to grow outward or be consumed by your own self-inflicted madness.
>
> If you search for flawless perfection using unethical means, that is the real paradox.

The 11+1 count can be frozen while its claims stay corrigible. That governance sentence is not this one. This one says why the freeze is not a demand for a risk-free world, and why waiting for flawless perfection is not the deep ethical path. The 10+1 is the baseline that has to stay in the layer. Seeing the value of a distinction is not the same as using that baseline.

1.11 A small observational use

The metaphysical vocabulary does not need to be settled before the model can generate inspectable questions:

1. **Possibility field:** What relations or interpretations were still live before attention narrowed?
2. **Focus:** What became foreground, and why?
3. **Awareness:** Did the reasoner remember that the foreground was only part of the object?
4. **Fear distortion:** Did an imagined future danger quietly acquire the status of present evidence?

5. **Recovery:** Could clarification, humor, a source check, or correction reopen the excluded field?
6. **Selection:** After reopening, which interpretation best corresponded to the object and consequences?
7. **Persistence:** Did the restored distinction govern the next move?

These questions can produce behavioral observations. They do not prove the complete TCoAw account, John's interpretation of his NDE, or a quantum mechanism of mind.

1.12 What this page asks from a reader

It does not ask:

- "Do you believe John?"
- "Do you accept his NDE interpretation?"
- "Do you agree with every connection?"
- "Has quantum consciousness been proved?"

It asks something more proportionate:

> **Can this model help you comprehend why John reasons topologically, why he protects healthy ambiguity from premature closure, why fear-generated attention capture matters to him, and how his NDE and Asperger sides are experienced by him as a working fusion?**

Understanding that object comes before accepting, rejecting, testing, correcting, or extending it.

The model remains open to all five.

Primary source: John Kuhles, *TCoAw Triad Metacognition Deep Ethical Quantum Mind Compact*, written 7 July 2026 and supplied 4 October 2026. Direct formulations are quoted. The connective explanation is an A.I.-assisted editorial synthesis and remains corrigible by John and later evidence.

Narcissism Expert Richard Grannon: Britain Is Being Emotionally Manipulated — andrew gold | heretics.. Published 19 April 2026. YouTube displayed approximately 124,000 views when checked on 9 October 2026.

Independent-media lineage: Andrew Gold made and presented documentaries for the BBC and HBO before building Heretics as his own independent interview and writing platform. Andrew Gold biography · Heretics — About

Why it belongs here: The conversation proposes a population-scale emotional-manipulation account using psychological vocabulary. It is a useful test of causal evidence, national generalization, diagnostic language, audience resonance and self-application by host, guest and project.

On this page, test the video specifically against TCoAw — Conceptual Topological Reasoning:

Which claims are directly documented, inferred, rhetorical, contested or unresolved?

What does the host or guest preserve, compress, omit or substitute—and does this page repeat any of those transformations?

Which incentives, authority relations and affected parties remain outside the visible frame?

What evidence or later outcome would correct the speaker, audience, platform or ACCM Deep Ethics Project reading?

Provisional selection. Reach makes the framing socially consequential; it does not settle the claims. The video can be replaced when a closer, stronger or more inspectable specimen appears.

Triad extension — temporary foreground as a referenceable freeze

The October 17 triad develops the freeze inside the flux. Thinking can hold the wider field, Consciousness can select a temporary foreground, and Awareness can retain that the foreground is partial and temporal.

A temporary freeze is compatible with corrigibility when it remains usable as the best available state and keeps a route for future reopening. Without a referenceable footprint, later improvement has nothing to differ from. With only the footprint, one moment is mistaken for the continuing field.

The phrase **if any** matters: later audit may find a correction, an improvement, or no material reason to change the state. See the triad field note.
