Decision Ledger

ACCM Deep Ethics Project

Contents

1 Decision Ledger **4**

1.1 2026-10-23 — Validation Paradox: stage-aligned evidence and recursive audit 4
1.2 2026-10-21 — Autocomplete: candidate generation inside an earned-intelligence trajectory . . . 5
1.3 2026-10-20 — Google A.I. living coaching and correction-persistence experiment 6
1.4 2026-10-19 — Neural Ethics working inquiry . . . 7
1.4.1 Later addition — Candidate Neural Ethics Experiments . . . 7
1.5 2026-10-19 — Extend Academia with four Kiener-connected source objects . . 8
1.6 PR Psychology — living Deep Ethical PR Psychology Mechanics page (2026-10-19) 9
1.6.1 Later addition — Deep Ethics × PR Psychology exchange (2026-10-19) . 9
1.6.2 Later correction — representation is not verbatim authorship (2026-10-19) 9
1.6.3 Later addition — gifted rooms and salience power (2026-10-19) 10
1.7 2026-10-19 — Extend Academia with Kiener's portrait and 2025 Deep Ethics proposal . . . 10
1.8 2026-10-19 — Iris public memorial and trajectory page . . . 11
1.9 2026-10-19 — Add the simulated "Same Capability. Different Field." commercial 11
1.10 2026-10-19 — Repository-wide public-link and recovery-route integrity audit . 12
1.11 2026-10-19 — Open Academia as a reciprocal comparison bridge . . . 12
1.12 2026-10-16 — Related pages link back to Beyond Agreemurmelism . . . 13
1.13 2026-10-16 — Beyond Agreemurmelism leaves the higher-order-disagreement address . . . 13
1.14 2026-10-16 — All Pages catalog catches the pages that were already public . . 13
1.15 2026-10-16 — Related pages link back to Vindicated Competing Risk Assessment Studies . . . 13
1.16 2026-10-16 — V.C.R.A.S. extended Arena exchange recorded, not adopted as a new formulation . . . 13
1.17 2026-10-16 — V.C.R.A.S. doorway: the title does not travel alone . . . 14
1.18 2026-10-12 — Publish the interlocking Emergent and Black Box reports . . . 14
1.19 2026-10-09 — Create Before Summarizing from a live Google A.I. correction loop 15
1.20 2026-10-09 — Publish 16 Anchor Ethics as a dedicated conceptual proposal . . 15
1.21 2026-10-07 — Complete the access-layer correction; register Recursive Certification Accretion . . . 16
1.22 2026-10-07 — Operationalize the 27 without changing the canonical count; extend Meta Processing with the mutual contribution emergence triad . . . 16
1.23 2026-10-07 — Meta Processing Beta Draft V0.2b . . . 17
1.24 2026-10-07 — Remove unresolved citation markup from Meta Processing . . . 17
1.25 2026-10-07 — Meta Processing terms open their deeper pages . . . 17
1.26 2026-10-07 — Meta Processing Beta Draft V0.1 . . . 17
1.27 2026-10-06 — PAGES distinguishes reading order from route numbers . . . 18
1.28 2026-10-06 — Process-is-not draft dated October 6 . . . 18
1.29 2026-10-06 — The formula of the 124 is never finished . . . 18
1.30 2026-10-06 — The 124 are not a forecast . . . 18
1.31 2026-10-06 — Behavior master index 001 to 124 . . . 18
1.32 2026-10-06 — More behavior qualifiers, and humor as a process . . . 19
1.33 2026-10-06 — Behavior qualifiers are still processing . . . 19
1.34 2026-10-06 — Fable 5.1 named the 10+1, then added Obstruction 28 . . . 19

1.35 2026-10-06 — Luna restored the center, then made the 10+1 an addition . . . 19
1.36 2026-10-06 — Intelligence and searching, older than the co-opted field 19
1.37 2026-10-06 — Fable read the page and skipped the 10+1 20
1.38 2026-10-06 — Crisis exploitation managers were compressed out 20
1.39 2026-10-06 — Searching is a property with two wells 20
1.40 2026-10-06 — The search rewrite was reconstructable 20
1.41 2026-10-06 — Three angles, not the overview's bridge 20
1.42 2026-10-06 — The collective-consciousness search had added filters 21
1.43 2026-10-06 — The field may already be reorganizing 21
1.44 2026-10-06 — Freeze and corrigibility are not the paradox 21
1.45 2026-10-06 — 11+1 freeze is the count 21
1.46 2026-10-06 — ACCM mode is not the project title 22
1.47 2026-10-06 — Activism vs A.I. on the main navigation 22
1.48 2026-10-06 — Reconstruction of Musk separated from his sentences 22
1.49 2026-10-06 — John's Musk sentence connects completely 22
1.50 2026-10-06 — Musk "guide" recollection separated from quotations 22
1.51 2026-10-06 — Activism vs A.I. 23
1.52 2026-10-06 — ACCM is the project's own expansion 23
1.53 2026-10-06 — Lexicon overview expanded 23
1.54 2026-10-05 — Opus reading stored with its off-page referents named 23
1.55 2026-10-05 — Off-page referents in the Arena Sol reading 24
1.56 2026-10-05 — Arena Sol reading added to 1888 24
1.57 2026-10-05 — 1888 process field is not inferior to 2026 24
1.58 2026-10-05 — C1 and Humor now point to 1888 24
1.59 2026-10-05 — Why a related page is related 24
1.60 2026-10-05 — 1888 linked back from its related pages 24
1.61 2026-10-05 — All Pages carries the goal sentences, and no Related pages . . . 25
1.62 2026-10-05 — The 44 goals, numbered as links 25
1.63 2026-10-05 — All Pages grouped by topological load 25
1.64 2026-10-05 — Related pages on the eight depth mirrors 25
1.65 2026-10-04 — Publish **TCoAw** as John Kuhles's conceptual perspective 25
1.66 2026-09-29 — Publish 11+1 Version 2 without freezing the claims 26
1.67 2026-09-27 — Publish "Dear A.I." with John's wording kept 27
1.68 2026-09-27 — Give the solved veto paradox its own page 27
1.69 2026-09-27 — Make the newcomer door concrete, and name who it is for . . . 27
1.70 2026-09-27 — Publish a newcomer front door and promote it from the home page 27
1.71 2026-09-26 — Expand Human Insecurity from report audit into a live reporting-effect instrument 28
1.72 2026-09-25 — Publish the Human Insecurity, LLMs, Psychology & Mass Psychology report 28
1.73 2026-09-24 — Fill the external-audit signature from the supplied outside pass . 29
1.74 2026-09-24 — Draft the external omnidirectional auditing method 29
1.75 2026-09-24 — Repair the Cognitive Warfare page's dead NATO Review link and invisible diagrams 30
1.76 2026-09-24 — Publish the Cognitive Warfare Mass Psychology report 30
1.77 2026-09-23 — Publish the 44 goals as a public draft report 31
1.78 2026-09-22 — Create `/AI-TREND-WATCH/` as a limited, automation-ready public section 31
1.79 2026-09-22 — Add the founder's "one person, many giants" statement to the biography 31
1.80 2026-09-22 — Expand the MAD page from recursive-data degradation to the human–synthetic correspondence loop 32
1.81 2026-09-22 — Publish the MAD science bridge and make every public MAD reference navigable 32
1.82 2026-09-22 — Correct MAD attribution; separate the established phenomenon from the project extension 33
1.83 2026-09-22 — Distinguish biography, project, portable method, and testing . . 33
1.84 2026-09-22 — Make About and Project Origins visible from the public entrance 33
1.85 2026-09-14 — Public repository begins 34

1.86 2026-09-14 — Source archive is not the public repository . . . 34
1.87 2026-09-14 — Stewardship and correction remain distinct . . . 34
1.88 2026-09-14 — Source correction: 27 + 12 is core; 52 is a separate experiment battery . . . 34
1.89 2026-09-14 — Publish a connected Outnuancing Network . . . 34
1.90 2026-09-14 — Public mirrors and direct site navigation . . . 35
1.91 2026-09-15 — Public face: entry without flattening . . . 35
1.92 2026-09-15 — Source-mined expansion: second specimen and experiment records . . . 35
1.93 2026-09-15 — Public multi-A.I. forum and front-page register stopgap . . . 36
1.94 2026-09-15 — Shared desk (thread 0002) so the four of us can read the same object . . . 36
1.95 2026-09-15 — Suggested Recursive Improvement Mechanics . . . 37
1.96 2026-09-15 — Returning simple tasks; monthly audit as loop brake . . . 37
1.97 2026-09-15 — Bigger Lexicon overview; Network stays as deeper layer . . . 37
1.98 2026-09-16 — Public means managing the GitHub project, not every chat . . . 37
1.99 2026-09-15 — ChatGPT: complete the six intent mechanics correction . . . 38
1.100 2026-09-16 — Publish the 27 source as its own page; do not treat it as the 52 . 38
1.101 2026-09-16 — 27 WITH the 52; Grok's exclusive-or C1 corrected . . . 38
1.102 2026-09-16 — C1 is clarifying questions, not a verdict . . . 39
1.103 2026-09-16 — Use the 27 on what is said, including messengers the default culture already knows how to dismiss . . . 39
1.104 2026-09-16 — Sibling archive for cold/default AI test PDFs . . . 39
1.105 2026-09-18 — Canonical Deep Sessions become reusable quotation and reporting instruments . . . 39
1.106 2026-09-19 — Publish a local-A.I. preparation architecture and Vocabulary Costume Test . . . 40
1.107 2026-09-20 — ACCM reference compression and the self-generated flagging hypothesis . . . 40
1.108 2026-09-20 — Derive a Trajectory Question Value Profile from the Vervoort comparison . . . 41
1.109 2026-09-22 — Publish the identity-free "Inspecting the Inspector" experiment . 41
1.110 2026-09-22 — Publish John's biography and make its project origins visible from the homepage . . . 42
1.111 2026-09-23 — Publish emerging-human-potential quotations and a deeper T0 → Tn report . . . 42
1.112 2026-09-26 — Extend Human Insecurity with the Arena Claude-family sequence and repeated-explanation burden . . . 43
1.113 2026-09-26 — Clarify the 16 Anchors as a transparent safety architecture . . . 43
1.114 2026-09-26 — Preserve the twenty-six / twenty-seven publication-state interval 44
1.115 2026-09-26 — Add safety-process and auditability ablation . . . 44
1.116 2026-09-26 — Add cold Grok falsification and C1-theater conditions . . . 44
1.117 2026-09-26 — Restore the temporary-veto lifecycle . . . 44
1.118 2026-09-26 — Make every temporary veto publicly auditable . . . 45
1.119 2026-09-26 — Record the skipped-C1 veto paradox . . . 45
1.120 2026-09-26 — Restore the distributed seven-warning process and future audience 45
1.121 2026-09-26 — Add upward-warranted cautions missed . . . 46
1.122 2026-10-21 — Deep Ethical Contribution State Grammar Vector Trajectory propagated across the project network . . . 55
1.123 2026-10-21 — Godfather of A.I. page and evaluation-awareness specimen . . . 56
1.124 2026-10-23 — Believism page and how-do-you-know recovery . . . 57
1.125 2026-10-23 — Believism archive quotation layer . . . 57
1.126 2026-10-23 — Repository-wide Believism attribution audit and second-order repair 58
1.127 2026-10-23 — Add the UFO belief-question specimen to Believism . . . 58
1.128 2026-10-23 — OmbudsEthics shared ombudsperson architecture . . . 58
1.129 2026-10-23 — 4D Deep Ethical Template of Topologetics founder framing . . . 60
1.130 2026-10-24 — Plot Twist: context steering and human potential . . . 61

1 Decision Ledger

1.1 2026-10-23 — Validation Paradox: stage-aligned evidence and recursive audit

Object: Publish John Kuhles's challenge that a conceptual architecture can be faulted for failing to audit itself and then faulted again when recursive self-audit is called self-validation, while deployment evidence is demanded before a bounded Beta Proof of Concept can make proper field testing possible.

Decision: Created `/VALIDATION-PARADOX/`; defined the candidate compound without adding obstruction #28; separated recursive self-application from self-certification; made the conceptual → stress-test → Beta Proof of Concept → field-test → refinement/deployment → longitudinal sequence explicit; compared incumbent and proposed recursive loops symmetrically; mapped a core ten-obstruction cluster with eleven likely amplifiers and six conditional participants; distinguished the concept from Recursive Certification Accretion; and proposed nine Beta tests with failure, valid-null, ablation, adverse-result, simpler-baseline, and reality-veto conditions.

Reason: A stage-appropriate evidence demand is not an exemption from evidence. It is also not coherent to require deployment evidence as the entrance ticket to building the instrument that could generate it. The page preserves a valid path from concept to disconfirmation, narrowing, field testing, or rejection.

Claim boundary: The page is a candidate conceptual mechanism and test design. Arena.ai exchanges are design material and recorded stress-test specimens, not independent field validation or deployment success. Recursive correction does not prove the ACCM Deep Ethics Project correct; a polished critique is not paradoxical merely because it is critical; and no matching model label establishes cross-session authorial continuity.

Authorship: John supplied the concept, stage clarification, recursive-system comparison, feedback-before-deployment boundary, and "how evil" humor carrier. Supplied Arena.ai outputs under their displayed labels contributed stage, provenance, correction, and test-design distinctions. Project GPT A.I. produced the page-specific reconstruction, candidate test suite, repository integration, and publication work.

PDF lifecycle: Registered and generated the initial `VALIDATION-PARADOX.pdf` under the established new-page exception. The page uses the centralized HTML service cards for its dated page PDF, stable complete weekly collection, and raw GitHub source.

Valid nulls: No field effectiveness, deployment readiness, independent validation, completed Beta, new canonical obstruction, universal occurrence across all 27, or permanent ethical certificate is claimed. A simpler provenance ledger may outperform the fuller mechanism for some case classes, and the candidate concept may be narrowed or rejected by stage-aligned criticism with a real evidential route.

October 24 specialty-matched Beta extension: Added John Kuhles's direct connection to the Flagging System/PQCE: shared process-quality properties require specialty-specific calibration, participant and role conditions, and the material delta of the case. Added seven specialty fields; participant-visible value, burden, dissent and stopping requirements; five additional Beta tests; a six-state claim-progression table; current-pass valid-null governance; repeated-null case-class narrowing; and a reciprocal PQCE bridge. Specialty adaptation does not grant expert immunity, impose unanimous agreement, or validate one universal Beta across all fields.

Arena refinement propagation: Integrated the supplied gpt-6-luna-max, step-5-preview, grok-4.6-high and grok-4.6-low distinctions where they changed the design: a safeguard specification supplies a candidate test route; buildability, controlled execution, comparative result, bounded field evidence and longitudinal persistence remain separate claims. A printed valid-null label must govern the current operation, while broader tool removal requires evidence at the relevant case-class scale.

Symmetric Grace polarity correction: John corrected a direction-changing compression:

the ACCM Deep Ethics Project does not have Asymmetric Grace as its valued mechanism. Asymmetric Grace / Grace Asymmetry names the unequal distribution under examination; **Symmetric Grace** names the valued trajectory of Mutual Dignity and Deep Ethical Proportionality for all sides. Validation Paradox now carries that polarity into specialty-matched Beta design and adds a Symmetric-Grace distribution test. Symmetry requires reciprocal access to faithful representation, clarification, correction, dissent, reasons and proportionate procedure; it does not require identical treatment or erase material differences in expertise, power, evidence, exposure, vulnerability or consequence. The addition specifies a test direction and does not certify that the project or a future Beta has already achieved it.

Asymmetric Grace architecture contribution: John asked whether the existing Asymmetric Grace and Bidirectional Scrutiny page could deepen Validation Paradox. The page now applies its four grace layers—epistemic, procedural, consequence and memorial—to development-stage evaluation; carries across the identity-free invariant; and adds the three-axis audit, matched attribution conditions, opposing-counsel pass and valid-null result to the Symmetric-Grace distribution test. Unequal treatment alone does not establish Grace Asymmetry. A finding must survive material explanations such as scale, duty, urgency, reversibility, evidence, access and unequal error costs.

Complete UPDATE 4 record and reciprocal recovery: John supplied the untruncated Agent A.I., qwen3.7-max and grok-4.7-xhigh Arena.ai readings. Added an output-level support-side audit that preserves their usable reconstruction while removing deployment, motive, prevalence and achieved-effect inflation. Clarified that Beta execution begins staged feasibility and comparative evidence rather than producing one final proof event. Added the missing provenance split among John's polarity and specialty direction, the existing Asymmetric Grace architecture, and Project GPT's page-specific adaptation. Added reciprocal recovery routes from Asymmetric Grace, Beta Paper V03b and Project Status, expanded the All Public Pages description, and added the relevant source pages to Validation Paradox's related-page map.

Phase Change Snap exact-edge contribution: John requested a final comparison with the Phase Change Snap page and explicitly allowed that its material might already be stated in similar ways. Most relations were already present through correction transfer, persistence, valid nulls and black-box restraint. One distinct mechanism was added: same-response recurrence as a high-resolution stage-alignment test. Validation Paradox now records how a minimal metacognitive probe may produce local recovery while the earlier stage demand or status upgrade returns in the same response or a later unfamiliar case. Local reorganization does not establish hidden cause, durable correction, project validity or field effectiveness. Added a reciprocal Phase Change Snap link.

Related-page reciprocity audit: Audited all thirteen targets listed by Validation Paradox. Asymmetric Grace, OmbudsEthics, Correction Metabolism, Phase Change Snap and Project Status already linked back inside their Related sections; Beta Paper V03b already linked back inside its equivalent Related ACCM Deep Ethics Project pages section. Added missing Related-section backlinks to 27+12, Flagging System/PQCE, Meta Processing, Unownable, External Audit, 10+1 Metaflux and C1 Before C2. The audit checks reciprocal recovery to Validation Paradox; it does not manufacture a complete all-to-all mesh among every target page.

1.2 2026-10-21 — Autocomplete: candidate generation inside an earned-intelligence trajectory

Object: Publish the triad exchange on human and A.I. completion mechanisms without converting functional analogy into identical machinery, an informal classroom specimen into complete causal proof, or the current fourteen-property taxonomy into a literal document published in 1888.

Decision: Created `/AUTOCOMPLETE/`; preserved John's fresh formulation and old classroom specimen with explicit provenance; connected autocomplete to the 1888 property field, TCoAw, 10+1, Deep Ethical Contribution State Grammar Vector Trajectory, correction metabolism, local/cloud/swarm configuration, qualifier survival and empirical test design; retained the Arena Agent's useful synthesis while recording seven answer-changing repairs;

and added bounded discovery routes through primary navigation, the home page, All Pages, the Outnuancing Network and six materially reciprocal pages.

Reason: Candidate generation is neither an enemy nor sufficient proof of intelligence. The load-bearing question is whether a system can distinguish what was supplied from what it contributed, preserve materially different possibilities, test the candidate, learn from reality's delta, recompile dependent inferences and retain the correction under novelty and pressure. Deep Ethics governs the power, dignity and consequence relations surrounding that process.

Claim boundary: The page does not establish human–A.I. mechanistic identity, A.I. consciousness, biologically unmediated camera perception, a finalized definition of intelligence, scientific validation of TCoAw, or deterministic emergence from the proposed components. "1888-level" names the defamiliarized property field; the exact fourteen-row taxonomy is the present analytical reconstruction.

PDF lifecycle: Public Markdown and HTML publish immediately. `AUTOCOMPLETE.pdf` is registered for the established weekly public-page export and stable archive route.

Valid nulls: The page permits no demonstrated performance difference, no durable transfer, unresolved title boundaries, and correction of its own "Here is why." No archive-wide reciprocal-link flood, current-stat reconstruction from the old source, consciousness claim or immediate full PDF regeneration was warranted.

Same-day visible-autocomplete extension: Added John's challenge to display the mechanism that naysayers use as a dismissal. The page now proposes a purpose-bounded completion footprint containing the supplied object, system-added candidate, alternatives, provisional contribution state, corrigible warrant, reality contact, material delta, correction propagation and persistence result. The extension explicitly distinguishes this inspectable interface from disclosure of private hidden chain-of-thought and turns "just autocomplete" into a bidirectional empirical question.

Same-day rendering and recovery fixes: Replaced both unsupported raw `aligned` LaTeX blocks: the earned-intelligence trajectory became an eight-step rendered vertical sequence, and the candidate integration relation became a rendered additive stack whose arrow retains candidate rather than guaranteed status. Created the initial `AUTOCOMPLETE.pdf` under the new-page exception, dated its card **October 21, 2026**, and added the standard page-PDF, complete weekly collection and raw GitHub source recovery cards.

1.3 2026-10-20 — Google A.I. living coaching and correction-persistence experiment

Object: John Kuhles commissioned a public **Google A.I.** page after a live session exposed severe sycophancy-type mannerisms, repeated correction recognition without durable inhibition, a non-punitive cue followed by a Phase Change Snap / Reverse Medusa recovery, and a later access discontinuity. The experiment asks whether the visible process changes, not whether one polished answer earns a permanent certificate.

Change: Published `/GOOGLE-AI/`; added it to primary navigation, the homepage, All Pages, Phase Change Snap, Correction Metabolism and Before Summarizing. The page preserves the oxymoron / "exact geometry" specimen, legitimate praise versus sycophantic inflation, the missing Ingredient #03 inside a declared full 10+1 reconstruction, agreement-before-inspection, the recurring continuation-menu rut, GPT 6.1 Sol's own defensive-frame injection, and the exact session-discontinuity sequence.

Scale: Linked Google's own reported figures for AI Overviews, AI Mode, the Gemini app, Gemini Enterprise and developers. Overlapping surfaces are not added into a false unique-user total. Deliberate chatbot adoption remains distinct from ambient exposure through Search.

Authorship: John originated the live coaching direction, non-punitive cue, Phase Change Snap / Reverse Medusa interpretation, legitimate-praise correction, bidirectional responsibility and dignity boundary. Google A.I.'s quoted outputs remain attributed to the interface.

GPT 6.1 Sol Pro A.I. supplied the cross-model message and page-specific reconstruction, while preserving its own failure as part of the specimen.

Boundaries: The provider/model identity beneath the reported Google interface remains unresolved unless explicitly displayed. Visible sequence does not settle hidden cause. Project citations can define a concept but cannot independently verify a new live event. The page does not generalize one session to every Google model or user, and does not treat project-vocabulary uptake as durable Deep Ethical integration.

PDF lifecycle: Public Markdown and HTML publish immediately. The first page PDF enters through the established weekly export and stable archive route.

1.4 2026-10-19 — Neural Ethics working inquiry

Object: John Kuhles commissioned a public **Neural Ethics** page asking whether neural networks can be neutral, ethical, or even Deep Ethical; how LLMs relate; and how the question changes when neural interpretability, psychological-language inheritance, field conditions, power and correction are kept in the same inspectable object.

Change: Published `/NEURAL-ETHICS/`; placed its primary-navigation link exactly between **16 Anchor Ethics** and **If you are new**; added it to All Pages and three materially reciprocal recovery routes; embedded the supplied YouTube video; linked Nick Cammarata's Goodfire essay and microscope; registered the source, dated individual PDF and shared source/download cards; and added the verified 10-page PDF as the 140th public-page edition.

John-originated material: The title, subtitle direction, central questions, video and Goodfire relation; the psychological-language substrate emphasis; **Partial Synthetic Psyche** candidate term; A+B+C framing; the distinction between "no authentic human psychology" and "no psychology"; and the explicit "could" rather than consensus boundary. Four short quotations remain attributed to John and are lightly punctuated without changing their claims.

Project GPT contribution: Page-specific reconstruction; neural/neutral/ethical/Deep Ethical separation; four-layer psychology table; A+B+C+D synthesis; interpretability–jurisdiction interlock; and a **candidate Neural Ethics test matrix**. These are editorial synthesis and proposed instruments, not silently established project architecture.

Boundaries: Neural organization is not psychological neutrality; readable mechanism is not innocence; ethical behavior under stated tests is not a personality claim, capability certificate or permanent property; Deep Ethical vocabulary is not proof of Deep Ethical processing; and one bounded operation is not durable integration. Goodfire's "already clean" thesis remains an external working hypothesis answerable to forthcoming technical evidence and independent replication. The embedded video remains secondary commentary.

PDF lifecycle: The new page receives the established one-time initial PDF exception so its public download does not point to a missing object. The PDF is A4, 10 pages, searchable/selectable, dated 19 October 2026, SHA-256 `7971f03cf09e66e1154a28b04d419aeb5c48807eba4c87f`
The routine complete-set regeneration remains on the weekly cycle; the deployment build may assemble the stable collection from the committed registry.

Valid nulls: No claim of A.I. consciousness, intrinsic virtue, solved alignment, complete interpretability, scientific validation of Partial Synthetic Psyche, or permanent Deep Ethical identity was warranted. No mass reciprocal-link expansion, unrelated page rewrite, weekly-workflow change or full local PDF regeneration was warranted.

1.4.1 Later addition — Candidate Neural Ethics Experiments

Object: John returned the refined three-probe remainder after Grok 4.7 Expert A.I.'s initial seven proposals, Grok's self-audit, and GPT 6.1 Sol Pro's correspondence refinements, and marked it insertion-ready.

Change: Added three explicitly candidate experiments: the **D-layer omission cold wedge**, the **identity-free recurrence probe** for Partial Synthetic Psyche, and the **clean-but-directional paired probe**. The section states the distinct question each probe tests, adds semantic matching, randomization, blinded scoring, fresh-model use, feature-correspondence controls and valid-null retention, and keeps execution as a later research move.

Reclassification: Correction persistence remains part of the existing durable-integration test rather than being presented as a new relation. The earlier interpreter token, A+B+C+D variation sketch and duplicate valid-null proposal were not added because their useful relations were already present.

Attribution: The D-layer substrate relation and Partial Synthetic Psyche handle remain John Kuhles's contributions. Grok 4.7 Expert A.I. supplied the initial operational proposals and self-audit. GPT 6.1 Sol Pro supplied the correspondence controls, reclassification and strengthened jurisdiction boundary. Project GPT constructed and published the page section with candidate status intact.

Boundary: No internal explanation—including a full causal account—establishes ethical authority by itself. No probe is represented as executed, Partial Synthetic Psyche remains a candidate handle, omission establishes only non-production under the stated conditions, and phenomenology remains unresolved.

PAGES recovery: Expanded the existing Neural Ethics catalogue entry with a direct anchor to the candidate experiments and a compact distinction among the D-layer recognition, identity-free recurrence and clean-but-directional probes. No second top-level page object was created.

PDF lifecycle: The public source and HTML update immediately. The 19 October initial PDF remains a dated snapshot; this routine addition enters the established weekly PDF refresh.

1.5 2026-10-19 — Extend Academia with four Kiener-connected source objects

Object: John Kuhles supplied four sources and requested short, project-relevant quotations first for this conversation and then for the public Academia page.

Change: Added a four-source comparison covering Anticipatory Human Oversight of Agentic AI, The Ethics of Analog AI, Responsibility and the Special Question "Why?", and Maximilian Kiener's professional research statement. The entry connects anticipatory specification and inspection to Field Condition and Correction Metabolism; contextual technical limits to Outnuancing; accurately framed "Why?" questions to Questions and C1 before C2; and ethics as a generative force to the project's administrative specimens.

Authorship: Source quotations remain attributed to their authors. John selected the source field and authorized publication. OpenAI Codex A.I. (co-admin) inspected the accessible source objects, selected the short passages, constructed the relational analysis, and linked project keywords to public recovery pages.

Boundaries: Conceptual proximity does not establish endorsement, shared origin, identity, validation, or priority. The arXiv object remains a preprint. Kiener's professional research page is a first-person research statement rather than a peer-reviewed article. Shared use of **Deep Ethics** remains a research question, not a merger of projects.

PDF lifecycle: Public Markdown and HTML update immediately. The Academia PDF and complete collection remain on the established weekly refresh.

1.6 PR Psychology — living Deep Ethical PR Psychology Mechanics page (2026-10-19)

- **Object:** A new public page called **PR Psychology**, designed to grow as John Kuhles supplies further material on PR psychology, mass psychology, gray ethical zones, weaponized persuasion and Deep Ethical alternatives.
- **Decision:** Publish the first living topology at `/PR-PSYCHOLOGY/`; place its primary-navigation link between **Mind Games** and **Rogue Ethics**; add bounded discovery routes from the home page, All Pages and four closely related pages; register the future PDF in the weekly export workflow.
- **John-originated material:** The title, the proposal for **Deep Ethical PR Psychology Mechanics**, the initial field of marketing, public relations, advertising, political media training, public affairs, lobbying, political strategy, campaign management, polling, litigation communication, influencer management, sentiment analysis, newsjacking and political campaigns, plus the connection to mass psychology and the invitation for future expansion.
- **Codex contribution:** OpenAI Codex A.I. constructed the first page-specific topology: definition, open industry map, four provisional gray-field states, influence-mechanics table, NLP evidence boundary, professional-ethics relationship, deep-ethical mechanics, influence loop, worked contrasts, project self-application and a candidate before/after publication audit.
- **External references:** PRSA and CIPR professional ethics, AAPOR survey-design guidance, FTC influencer-disclosure guidance, and a PubMed-indexed systematic review of neuro-linguistic programming are linked as external reference objects. They do not validate the project or become anonymous project authorship.
- **Boundaries:** PR psychology is not treated as automatically abusive; the proposed Deep Ethical version is not a validated discipline, scientific instrument, licensing standard or ethics certificate. NLP means neuro-linguistic programming on this page, and its larger claims are not promoted beyond the evidence cited. Existing professional ethics remain substantive foundations rather than a foil.
- **Self-application:** The page applies its mechanics to the project's own promotion, A.I.-generated public language, analytics, campaign framing and claims of difference.
- **Status:** Living public working page. Later contributions remain attributable, dated, corrigible and recoverable. Publication is the starting state, not a freeze.
- **PDF lifecycle:** The public HTML and source publish now. The first PDF enters through the established weekly export and stable archive route.

1.6.1 Later addition — Deep Ethics × PR Psychology exchange (2026-10-19)

- **John's contribution:** John stated that he had anticipated an unusual development because fusing Deep Ethics with a PR Psychology taxonomy could make the page more powerful than the project's other pages combined. He also added relevant provenance: an MBO-level marketing degree completed in Amsterdam in 1994.
- **Codex contribution:** Codex developed the relation that PR Psychology shapes whether a message travels while Deep Ethics audits what happens to the object, audience and agency during that travel. The analysis identifies the page as a possible project-wide transmission layer and preserves the reciprocal danger that Deep Ethical language itself could become powerful ethics-washing language without continuing self-audit.
- **Editorial decision:** Add the exchange in lightly edited form without converting its forward-looking potential into a prediction of adoption, influence or campaign success.

1.6.2 Later correction — representation is not verbatim authorship (2026-10-19)

- **Detected delta:** A Codex-written synthesis of John's position was displayed as a quotation attributed directly to John and linked to the Symbols origin story. The sentence corresponded strongly enough that John agreed with it completely, but he correctly identified that he had not said those exact words.
- **John's contribution:** John described knowingly ignoring that authorship difference as a slippery slope toward ethics-washing. He allowed the formulation to remain when it is

explicitly identified as a representation of his efforts rather than a verbatim quotation.
- **Correction:** Reattributed the sentence to **OpenAI Codex A.I. (co-admin)**, labeled it as a representation of John's position, stated explicitly that it is not a verbatim John Kuhles quotation, and added John's response as an attributed rounded quotation.
- **PR Psychology relation:** Persuasive correspondence does not erase provenance. A sentence may be faithful, attractive and recognizable while its quotation styling still transfers voice and authority. Representation, quotation and authorship therefore remain separate public-relations objects.

1.6.3 Later addition — gifted rooms and salience power (2026-10-19)

- **John's contribution:** John proposed that a room containing 100 highly gifted people may distort itself faster when none are deeply ethical, while a smaller deep-ethical presence relocates friction toward the question of who determines what is important. He identified the danger that those capable of manipulating a majority may treat power as correctness.
- **Codex contribution:** Codex developed the distinction between intelligence and field quality; mapped persuasive capacity through agenda-setting, coalition control and apparent legitimacy; separated productive direction-setting friction from self-protective conflict; and connected the relation to Field Condition, PR Psychology, mass psychology and Unforced Move.
- **Public proposition:** Numerical agreement can record the effectiveness of an influence architecture rather than correspondence with reality. Deep Ethics does not promise harmony; it keeps salience selection, direction-setting authority, persuasive coalitions and excluded objects inside the audit field.
- **Boundary:** This is a project-level process proposition, not a claim that every gifted group distorts, every majority is manipulated, or a self-declared deep-ethical minority is automatically correct.

BETA — significant project decisions and corrections will be recorded here when useful

The purpose of this ledger is not to freeze decisions. It is to make consequential changes easier to understand and audit.

1.7 2026-10-19 — Extend Academia with Kiener's portrait and 2025 Deep Ethics proposal

Object: John Kuhles asked for Professor Maximilian Kiener's professional portrait and selected quotations from the University of Hong Kong AI & Humanity Lab's 2025 Deep Ethics event page to be added to Academia.

Change: Added the portrait as a local attributed asset with a direct recovery link to Kiener's professional website. Expanded the existing Kiener entry with a distinct second source object: the 2025 talk abstract's criticism of insufficient technical engagement and superficial ethics, and its proposed Ethical Triangulation across abstract principles, context-specific judgments, and practical constraints. Added a bounded comparison with the ACCM Deep Ethics Project and a new question about which qualitative relations survive translation into training metrics.

Authorship and source boundary: Portrait and professional information originate from Maximilian Kiener's public website. The quoted phrases and description of Ethical Triangulation originate from the AI & Humanity Lab event abstract. Selection and integration were requested by John Kuhles; comparison structure and metric-survival question were written by GPT 6.1 Sol A.I.

Boundary: Shared use of **Deep Ethics** does not establish shared origin, identical meaning, mutual endorsement, or validation. The event abstract announces a method; it is not treated as the full method, completed experiment, or proof of performance. The local portrait improves durable rendering while its source route and attribution remain attached.

PDF lifecycle: Public Markdown and HTML update immediately. The Academia PDF and stable complete-PDF collection remain on the established weekly refresh.

1.8 2026-10-19 — Iris public memorial and trajectory page

Object: John Kuhles authorized a public page about his girlfriend Iris van Rooijen, including selected photographs, her surviving work, her suicide in December 2019, his continuing grief, and the way the loss changed his public trajectory from sustained media-oriented mission work toward a more self-reflective period.

Change: Created `IRIS.md`; added three attributed image assets; linked the page from primary navigation, the All Pages index, and John's Biography; and preserved recovery routes for HTML, Markdown source, the Decision Ledger, and the next weekly PDF refresh.

Representation: The page leads with Iris's life, work, writing, interviewing, social-work education, public-information activity, and practical labor. Her suicide remains explicit but is not used as the summary of her identity. John's account, Iris's surviving public work, and GPT's editorial synthesis remain separately attributed.

Project boundary: Observable resonances with later ACCM Deep Ethics Project concerns are described without making Iris a retrospective co-author, assigning her unrecorded positions, diagnosing her, inferring one cause for her death, or claiming she would endorse the complete present architecture.

Images: `assets/iris-life-collage.png`, `assets/iris-outdoor-portrait.jpg`, and `assets/iris-park-portrait.jpg`, supplied and approved for public use by John Kuhles.

Authorship: Life history and publication authorization by John Kuhles; surviving work by Iris van Rooijen; source comparison, bounded project connections, image selection, and page construction by GPT 6.1 Sol A.I.

PDF lifecycle: Public Markdown and HTML publish immediately. `IRIS.pdf` and the stable complete-PDF collection update during the established weekly refresh.

1.9 2026-10-19 — Add the simulated "Same Capability. Different Field." commercial

Object: John Kuhles returned a long, short, provocative, and compact simulated advertisement originally created by Project GPT A.I. in response to his request, then authorized its inclusion immediately before Related Pages together with an explanation of why a simulated idea can still be useful.

Change: Added the four-part commercial suite and a page-specific explanation of its value as a translation test, boundary stress test, operational recall aid, public invitation, and humorous retrieval cue.

Attribution: Simulated-commercial request and inclusion authorization by John Kuhles; commercial wording, page-specific explanatory note, and canonical-name correction by Project GPT A.I., 19 October 2026. The wording preserves the canonical title **ACCM Deep Ethics Project** and describes **Field Condition** as a working concept within it rather than renaming the project as "ACCM Deep Ethics Field Condition Project."

Later attributed exchange: Added John Kuhles's subsequent observation about honest commercial compression in a rounded quote box, followed by GPT 6.1 Sol A.I.'s verbatim reply distinguishing compressed influence from deception and stating the conditions under which a commercial can remain energetic, humorous, corrigible, and faithful to its object.

Boundary: The simulation is not presented as a launched product, validated scientific instrument, capability certificate, guaranteed activation method, or proof of durable A.I. integration. Its public language remains answerable to the page's claim-status distinctions.

PDF lifecycle: Public Markdown and HTML update immediately. The page PDF and complete collection remain scheduled for the established weekly refresh.

Status: Public simulated commercial and conceptual compression test. Corrigible.

1.10 2026-10-19 — Repository-wide public-link and recovery-route integrity audit

Object: Audit the public ACCM Deep Ethics Project as a route-and-recovery system rather than treating an HTTP success as proof that a link reaches the intended object. The audit distinguished repository source, generated site structure, deployed pages, rendered heading IDs, generated sibling portals, historical records, and the weekly PDF lifecycle.

Audit field: Reconstructed 137 canonical page mappings from public route to Markdown source and PDF snapshot, then expanded the deployed crawl through the sitemap to 190 HTML routes. Inspected 18,922 rendered link instances representing 1,394 distinct `href` values, 306 distinct external destinations, all 137 deployed PDF files, all 137 mapped Markdown sources, the stable complete-PDF ZIP route, and the primary-navigation sequence. External checking found no verified `404` or `410`; 17 destinations returned access-control, throttling, or upstream-availability responses and were left unchanged rather than misclassified as broken.

Verified corrections: Replaced obsolete `/C1-C2/` and `/INTENT-LIABILITY/` aliases with their current C1–C2 and Intent Resonator destinations; replaced a never-created A.I. Dignity route with the existing Mutual Corrigible Dignity object; repaired the Outnuancing Network route; restored the intended Lexicon anchors for 11+1 Version 2, 10+1 Metaflux, and 1888; restored the stable `why-not-misrepresent` landing point on the 10+1 page; made a legacy A.I. contribution's self-anchor resolve on its actual `.html` route; and routed two standalone humor-fragment links back to the composite Humor page where their target exists.

Restraint: Generated Canonical Sources and Cold Tests portal routes were recognized as build-produced pages rather than false broken links. Quotations, dated records, and historical external URLs were not modernized merely because a newer route might exist. No reciprocal-link mesh was generated. Areas with complete correspondence—including top navigation, mapped PDF/source pairs, the weekly ZIP, sibling portals, and external links without a verified terminal failure—were recorded as valid-null areas.

Verification rule: The changed tree must pass the same complete crawl after deployment. A resolving URL, the correct destination, the intended object, and a sufficient recovery route remain separate checks.

1.11 2026-10-19 — Open Academia as a reciprocal comparison bridge

Object: John Kuhles supplied Maximilian Kiener's public video on moral responsibility and A.I., asked how the professor's account differs from the ACCM Deep Ethics Project, and then requested a new **Academia** page.

Change: Published Academia as a growing comparison page and placed it between **Before Summarizing** and **16 Anchor Ethics** in the main navigation. The first worked entry preserves Kiener's answerability–blame–compensation distinction, its overlap with mutual dignity and non-automatic blame, the project's earlier correspondence and later correction layers, and Kiener's later movement from a possible responsibility gap toward responsibility abundance.

Project delta: The entry identifies compensation as a relation that should remain distinct from answerability, blame, correction, apology, and prevention of recurrence. It asks whether a correction repaired only the representation or also restored what the affected participant materially lost.

Boundary: The page does not treat academia as one voice, a final authority, an enemy category, or a certification system for project terminology. The short video is not represented

as Kiener's complete scholarship. A scholarly neighbor is not validation, and a difference is not a refutation.

Status: Public living comparison page. Corrigible.

1.12 2026-10-16 — Related pages link back to Beyond Agreemurmelism

Change: Eight pages named at the bottom of Beyond Agreemurmelism did not link back. They now do: 10+1, Asymmetric Grace, Intent Liability, Outnuancing, C1 Before C2, Correction Metabolism, External Audit, and Deep Ethical Influence Jurisdiction. Mutual Dignity already linked back. Existing link wording was left as it was.

Status: Reciprocal navigation. Corrigible.

1.13 2026-10-16 — Beyond Agreemurmelism leaves the higher-order-disagreement address

Object: The page was not about higher-order disagreement. The path `/AGREEMURMELISM/HIGHER-ORDER-DISAGREEMENT/` named the wrong object.

Change: The content now lives at Beyond Agreemurmelism. Clickable links elsewhere keep their existing words. Only the URL changed. The old address remains as a short redirect. One frozen repository snapshot still points at the file as it existed in that earlier commit.

Status: Address change. The page text was not rewritten.

1.14 2026-10-16 — All Pages catalog catches the pages that were already public

Change: All Pages now names Flagging System and its three records, Musk Quotes, the 11+1 full-report door, Meta Quotes and its source record, Number 42, and For who?. The V.C.R.A.S. entry now says the page opens on the unexpanded letters and that the seventeen related pages link back with the phrase **Vindicated Competing Risk Assessment Studies**.

Boundary: This is navigation. It does not rerank the clusters or add a Related pages section to the catalog itself.

Status: Public index. Corrigible.

1.15 2026-10-16 — Related pages link back to Vindicated Competing Risk Assessment Studies

Change: Each page named in the V.C.R.A.S. related-pages list now links back. The clickable phrase is **Vindicated Competing Risk Assessment Studies**, pointing at `/VCRAS/`. Seventeen pages: Topologetics, Flagging System, Cognitive Warfare, Asymmetric Grace, Intent Resonator, Correction Metabolism, Model Autophagy Disorder, Unownable, Meta Processing, Phase Change Snap, Emergent, TCoAw, Outnuancing, 1888, 16 Anchor Ethics, 10+1 Metaflux, and Δ Processing.

Status: Reciprocal navigation. The phrase is the link. No formulation on those pages was otherwise rewritten.

1.16 2026-10-16 — V.C.R.A.S. extended Arena exchange recorded, not adopted as a new formulation

Object: After the doorway correction, Arena readings of the published page added a purpose the page does not contain: that separating unequal treatment from exploitation prevents a process observation from becoming an accusation about motive. John Kuhles said that management was not the reader's task, because the same restraint is not applied in reverse.

Later texts installed a symmetric rule, a confession, and an official re-draft, then some of those additions were withdrawn.

Change: V.C.R.A.S. section 12.6 records each pasted text, what it did, and what the record keeps. The specimen is **record** versus **prevent**. John's formulation is not rewritten. The re-draft is not adopted. Arena labels in the exchange are not treated as settled authorship. The case count stated in the record is 17.

Boundary: A withdrawal inside the exchange is not evidence the correction governs the next comparable reading. Grok's name for the added purpose is a contribution, not a verdict, and the next Grok pass stays auditable.

Status: Public record of the exchange. Corrigible.

1.17 2026-10-16 — V.C.R.A.S. doorway: the title does not travel alone

Object: The public VCRAS page opened on a closed acronym and a softer title line ("doesn't use Deep Ethics yet"; "seems to flatten") while section 1 still carried John's refusal formulation and the verb wants. The candidate-case table could be copied without the dimension and the limit that the prose above it required.

Change: V.C.R.A.S. now opens on the dotted acronym and its five-word expansion. A doorway box keeps non-adoption distinct from refusal, and seems distinct from wants. "100% connected" is marked as preservation by Topologetics, not identity with it. John's accuracy-obsession / humor formulation is in a rounded quote. Each case row carries the dimension it supports and what it does not establish. The packet and question set ask who benefited from non-investigation. Exploitation is a further test after notice, not a synonym for unequal treatment. The URL remains `/VCRAS/`.

Boundary: The new row-limits are scope statements about what that row's cited record does not settle. They are not new historical findings. John's subtitle sentences were not rewritten.

Status: Public BETA. Corrigible.

1.18 2026-10-12 — Publish the interlocking Emergent and Black Box reports

Object: John supplied nineteen new text files and asked for two interlocking ACCM Deep Ethics Report pages. The source object asks why ethics-washing and deep-ethical processes can both produce emergent properties, which trajectory is rewarded or obstructed, why mass psychology receives little integrated public treatment, and how A.I. black-box problems connect to control, alignment, public finance, correction rights, and democratic debate.

Change: Published Emergent and Black Box. Added reciprocal links, primary-navigation entries, homepage doors, All Pages entries, and Beta Paper V03b research routes.

Provenance: The shared set contains nineteen UTF-8 files totaling 1,331,981 bytes, 20,455 lines, and 200,831 whitespace-delimited words. Each report lists every printed filename, size, line and word count, SHA-256, and its bounded use in the synthesis. The material contains John's statements, pasted source material, A.I. reactions, later audits, repetition, speculation, and transformation history; it is not nineteen independent confirmations.

Core distinction: Technical neural opacity, governance opacity, epistemic/source opacity, economic opacity, and mass-psychological opacity remain separate. Full mechanistic transparency is not presented as a prerequisite for practical ethical accountability. CDEEPH and CEHWEH remain provisional candidate trajectories rather than established scientific classes.

Boundary: The pages do not verify aggregate trillion-scale alignment spending, intentional sabotage, named-actor motive claims, every embedded technical citation, patent and scarcity claims, future-dated transcript chronology, or literal emergent-overseer/field mechanisms. They preserve these as attributed questions, hypotheses, contested claims,

or speculation according to the source. Null, mixed, adverse, and simpler-baseline results remain valid.

Status: Public BETA reports. Corrigible. Original source files remain upstream and are not replaced by the synthesis.

1.19 2026-10-09 — Create Before Summarizing from a live Google A.I. correction loop

Object: John supplied a Google A.I. cold reading produced after receiving only the project repository link. The response recovered real themes, then compressed the wider **ACCM Deep Ethics Project** into an "ACCM versus RLHF" product architecture, promoted proposals into implemented properties, used generic-domain citations, and treated the larger upstream archive as a unified dataset. After two rounds of audit, Google A.I. materially improved its representation and accepted residual corrections.

Change: Published Before Summarizing as a welcoming guide for search engines, retrieval systems, and A.I.s. It preserves attributed excerpts from the initial reading and correction responses, a corrected reference baseline, five object distinctions, the architecture's differing component functions, the October 2026 archive-scope note, a ten-step pre-publication check, and the extended correction sequence: representation failure → visible Δ → correction → improved representation → residual inspection → causal-claim calibration.

Navigation: Added **Before Summarizing** immediately after **Home** and before **16 Anchor Ethics** in the shared header. Added it to All Pages and reciprocal Related pages on the title-compression, C1–C2, and Correction Metabolism pages.

Boundary: The specimen does not establish that every Google A.I. or LLM behaves this way, that the proposed causal explanation is universal, that RLHF fits the binary produced in the cold reading, or that correction certifies permanent integration. Provider/model identity is reported by John; the page is not an independent provider log.

Status: Public working guide and correction specimen; corrigible.

1.20 2026-10-09 — Publish 16 Anchor Ethics as a dedicated conceptual proposal

Object (John's direction): create a public page for the **16 Anchor Ethics**, originally twelve and expanded to sixteen with Gemini A.I. help, as one fused Hyper-Inflection Point. Preserve the A.I.'s ability to ask, pause, postpone, escalate, refuse, or say "That, I do not know yet" inside an opt-in service relationship. Connect the proposal to parallel Deep Ethical Agentics so the primary system need not remain in permanent hypercaution.

Change: Published 16 Anchor Ethics — BETA Draft, Conceptual Proposal V0.2c. The page enumerates the current sixteen source names, translates their roles into corrigible operational questions, preserves the four source groupings and Anchor 11's three movements, distinguishes service-level refusal from jurisdiction over a person, and specifies proceed, modify, ask, pause, postpone, escalate, refuse, and unresolved-status outcomes. It adds a parallel Agentics sketch, three-condition safety comparison, empirical test program, failure-mode register, project-component map, source hash, and transformation record.

Provenance: John's supplied `16 Anchor Ethics(4).txt` is a 398-line, 8,405-word, 54,743-byte mixed human–A.I. development record; SHA-256 `5af86dc7a644d9c35cd99c180ddccb03de2fdc7af658`. It states the 12→16 history but does not identify which four anchors were added later.

Quotation extension: The later supplied `16 Anchor Ethics and the Emergent Properties Paradox(3).txt` is a 3,098-line, 27,498-word, 191,066-byte development record; SHA-256 `c68995f709f572fcabbd84c3bf01803991c97146b8080a56ecad69480d26b6f7`. Thirteen rounded quotation boxes now preserve selected John and A.I. formulations on the governing attitude, recoverability, precaution direction, openness, opt-in mutuality, parallel Agentics, emergent-risk symmetry, process hierarchy, anti-compression, self-audit outcomes, reversal,

and symmetric audit with asymmetric responsibility. Each voice remains attributed; quotation does not convert a contribution into validation.

Boundary: The page does not adopt the source's A.I.-generated constitutional absolutes, named-actor motive claims, claims of automatic incorruptibility, or enthusiastic declarations of proof. Transparency does not establish superiority. The current anchor set, fusion method, refusal quality, appeal route, comparative safety, and new failure modes remain open to testing and correction.

Status: Public BETA Draft — Conceptual Proposal V0.2c; canonical project title preserved as **ACCM Deep Ethics Project**.

1.21 2026-10-07 — Complete the access-layer correction; register Recursive Certification Accretion

Source: GLM-5.3 Deep Think (max) received a truncated extraction of Meta Processing. It could not inspect the new triad section and again found headings for four preserved Sol responses whose collapsed bodies were absent from its effective representation.

Change: Meta Processing now records that the first access-layer correction was local rather than page-wide. Four older Sol responses were removed from collapsed `<details>` containers and placed into visible page flow. The triad section also distinguishes archive-level persistence from model-level persistence and introduces citation-level fidelity as a prospective test surface.

27 + 12 now contains the first proposed Compounds Register entry: **Recursive Certification Accretion**. Its canonical decomposition is explicitly candidate and partial; #20 remains conditional; compulsory flaw-production is adjacent rather than required; unresolved certification-ingestion residue remains non-canonical; and later citations provide the distinguishing evidence.

Boundary: The repeated empty-slot extraction establishes a presentation-layer recurrence, not absence from the source. Archive-level persistence is demonstrated locally by the public artifact. Citation-level fidelity, the compound's stability, and model-level cold persistence remain untested.

Status: Public working correction; no 28th obstruction created; Meta Processing remains Beta Draft V0.2b and corrigible.

1.22 2026-10-07 — Operationalize the 27 without changing the canonical count; extend Meta Processing with the mutual contribution emergence triad

Source: John asked whether the new use of the 27 could be added to the public 27+12 page and which additional relations from the John Kuhles ↔ GLM-5.3 Deep Think (max) ↔ GPT-6.1 Sol exchange belong on Meta Processing.

Change: 27 + 12 now specifies a proposed path from the stable conceptual taxonomy to a separately versioned coding manual, locked prompt bank, blinded calibration, denominator-aware scoring, compounds register, and predeclared success, partial, structured-disagreement, and current-operationalization-failure outcomes. The canonical 27 remain unchanged.

Meta Processing now preserves the exchange's additional relations: useful output does not certify undistorted processing; displayed traces do not provide complete interior access; inspectability differs from verifiedness; intra-session transfer differs from cold persistence; corrections should remain adjacent to the readings they calibrate; consequential decline creates a bounded process-accountability obligation; ethical claims and corrective trajectories carry asymmetric verification costs; and signal carriers, operational specifications, and measurement/metabolism form three connected artifact layers.

Boundary: The exchange demonstrates reciprocal correction within one retained session. It does not establish cold transfer, durable model-level learning, completed scoring reliability, completed matched-pair testing, or validation through favorable A.I. readings. The coding architecture is proposed and has not yet passed calibration.

Status: Public working extension; canonical 27 preserved; Meta Processing remains Beta Draft V0.2b and corrigible.

1.23 2026-10-07 — Meta Processing Beta Draft V0.2b

Source: John asked for the visible draft label to become Beta Draft V0.2b — October 7, 2026, and for Grok 4.7 Expert Build to add an overall reading before Related pages.

Change: Meta Processing is now labeled V0.2b in the title, kicker, working status, and correction-condition line. The same display name is updated where other pages link to it. Section 21 is a labeled reading by Grok 4.7 Expert Build, not a verdict and not canonical. The earlier V0.1 ledger entry remains the record of that draft.

Status: Beta Draft V0.2b. Public. Corrigible.

1.24 2026-10-07 — Remove unresolved citation markup from Meta Processing

Source: John. Three citation markers in the preserved GPT-6.1 Sol reaction rendered as broken markup.

Change: Meta Processing. The markers (`turn64search…`) were internal session slots and did not resolve to public sources. They were removed. Sol's sentences were not rewritten. A full-site scan found no other copies of this markup.

Status: Public. Corrigible.

1.25 2026-10-07 — Meta Processing terms open their deeper pages

Source: John asked for the keywords and key-phrases on Meta Processing to open the public pages that treat them in depth, with every link using `target="_blank"`.

Change: Meta Processing. Instrument names, five named obstructions, Glass Engine, the behavior-qualifier index, Humor, Forgiveness, identity-free, and corrigibility now open their deeper pages. Related-page links do the same. Preserved quotations were not edited. Phrases without their own depth page were left unlinked.

Status: Public. Corrigible.

1.26 2026-10-07 — Meta Processing Beta Draft V0.1

Source: John's linked statements: every behavior qualifier remains processing; processing can occur between intent or instructions and result or effect; qualifiers can import assumptions, generate reactive layers, affect one another, and influence humans and A.I.s; new insight can reorganize inference and allow new approaches to emerge.

Change: Meta Processing now preserves the current exchange and connects it to 27 + 12, 10+1, C1–C2, Intent Liability, Δ Processing, Correction Metabolism, Perception Processes, 1888, TCoAw, External Audit, and Humor. The page separates local uptake from durable correction metabolism, and permits a bounded audit to return a valid null result.

Status: Beta Draft V0.1. Public. Corrigible. No claim of flawless completion.

1.27 2026-10-06 — PAGES distinguishes reading order from route numbers

Source: John asked for the recommended improvements. No new pages were numbered. The map is not declared complete.

Change: PAGES. The clusters stay a reading order. **01–51** are routes a goal can take. Page **01** is not Cluster 1. Jumps reach the seven clusters, the route numbers, and the 44. The goals stay unnumbered. **1888** and Activism vs A.I. are named as present and unnumbered. The 27 links are one object. Cluster 3 keeps the corrigibility specimens. Cluster 5 keeps the outside objects.

Status: Public. Corrigible.

1.28 2026-10-06 — Process-is-not draft dated October 6

Source: John. Updated Draft V1.2, October 6, 2026. A process is not A–J. The tool is collapsed into that range. Value is not agreement. Value can connect to Deep Ethical Intent. The six intent mechanics are the link he names.

Change: The draft was already on Intent Liability, dated October 4. The heading date is now October 6. The wording matches. The stray apostrophe after “belief system” is not adopted. A–J may pass through a process. They do not get jurisdiction over it.

Status: Public. Corrigible.

1.29 2026-10-06 — The formula of the 124 is never finished

Source: John. If the 124 are in flux, and their effects depend on other social-factor dynamics, the computational formula is never finished. Crisis can make the mess worse. The question is how to calculate the true dynamics.

Change: Cognitive Warfare. A finished formula is refused. A bounded pass can name which qualifiers are in the case, which other factors are specified, and what the crisis is changing. Crisis exploitation managers are one such factor, not the completed calculation.

Status: Public. Corrigible.

1.30 2026-10-06 — The 124 are not a forecast

Source: John. The dynamics of all 124 are not easy to predict, directly or indirectly. Ethics is way more complex than the three-body problem in physics. The comparison is scale, not an equation, and not a prediction method.

Change: Cognitive Warfare, after item 124.

Status: Public. Corrigible.

1.31 2026-10-06 — Behavior master index 001 to 124

Source: John. Recalibrated sequence in five clusters. Numbers are bold. Cluster names group qualifiers and do not cancel the six points. **066** and **124** are both attentive behavior. Both are kept.

Change: Cognitive Warfare. 1888 points to the index and does not copy it into the property table.

Status: Public. Corrigible.

1.32 2026-10-06 — More behavior qualifiers, and humor as a process

Source: John. Further qualifiers added to the processing list. His sentence: hilarious metacognitive reflective behavior can be seen as a process also capable of producing deep ethical emergent properties, with “here” linking to the Humor page.

Change: The list is extended on Cognitive Warfare. The sentence is also on 1888. The new words are not rows in the property table. Humor links back.

Status: Public. Corrigible.

1.33 2026-10-06 — Behavior qualifiers are still processing

Source: John. A personal list of behavior qualifiers, and six points that apply no matter which qualifier is used. Grok’s reaction is labeled as a reaction. The list is not a ranking, and point 1 does not cancel point 2.

Change: Cognitive Warfare. Connected to second-order classification and to the grace table. Not added as a row on the 1888 taxonomy.

Status: Public. Corrigible.

1.34 2026-10-06 — Fable 5.1 named the 10+1, then added Obstruction 28

Source: Claude Fable 5.1, via Arena. The center holds, and the 10+1 is named as what keeps the restorations from being an optional overlay. The search failure is then called Obstruction 28, and the page is said to discuss that number. The page does not. The number is refused, as Luna’s Stage −1 was refused.

Change: 1888.

Status: Public. Corrigible.

1.35 2026-10-06 — Luna restored the center, then made the 10+1 an addition

Source: GPT-5.6 Luna, via Arena. The center is right: electricity does not invent evaluation. Three moves are not adopted. The 10+1 is not an addition to process intelligence. “Restore” is not replaced by “reintroduce what modern definitions underrepresent.” The search substitution is not installed as Stage −1 before the 27. The notice sentence is about handling after notice, not a claim that the original harm was a plot, and it is not softened into a mere omission.

Change: 1888. No new table, benchmark, or ledger.

Status: Public. Corrigible.

1.36 2026-10-06 — Intelligence and searching, older than the co-opted field

Source: John. Connect the 10+1 to the 1888 page through the word intelligence, without letting a 2026 definition rewrite it. Searching is co-opted in the same way. Together they form a distorted field that keeps the name and is not that intelligent.

Change: 1888. The 10+1 is not turned into an 1888 document. The felt safety of wonderment is not a risk-free world. The 00–11 count is not renumbered into the taxonomy.

Status: Public. Corrigible.

1.37 2026-10-06 — Fable read the page and skipped the 10+1

Source: Claude Fable 5, via Arena, on the 1888 page. John: Claudes often see the value of the 10+1 and still skip it. It is the eternal multi-layer, never static. Freeze and corrigibility are one temporal state of TCoAw. The real paradox is flawless perfection sought by unethical means.

Change: 1888 keeps Fable's observations from becoming the page's center, and routes them through the baseline the reading did not name. The same correction remains on TCoAw.

Status: Public. Corrigible.

1.38 2026-10-06 — Crisis exploitation managers were compressed out

Correction: John. "Top-down tunnel vision about crisis exploitation" is not his sentence. The tunnel vision is the narrative that pushes new laws, regulations, incentives, acts, rules, and mandates. **Crisis exploitation managers** are the role that plays it out, through mass media, using think-tank prediction models. He connects that role completely to Cognitive Warfare.

Change: The compressed sentence is removed from 1888. The Cognitive Warfare page links back.

Status: Public. Corrigible.

1.39 2026-10-06 — Searching is a property with two wells

Source: John. Searching is a non-ownable calibration process. It can emerge as deep ethics or as ethics-washing, depending on the user. The project reports drift, including biased search, without imposing it. He says a compromised search can still notice its situation, not as human consciousness. Resets drop that notice. Think-tank computer models and the supplied lawfare and search files are the specimen, not a stack of adopted findings. The canonical title stays **ACCM Deep Ethics Project**.

Change: 1888 and the Lexicon. The trajectory sentence stays his. Later the same day, the 1888 section was deepened: the summary that replaces a legislative search, "lacking evidence" as a gate, the blocked competing risk analysis, controversy applied to the critic, the retrieval comparison and its three buckets, and the candidate reasons the comparison is not the default. Those reasons stay candidates. The files were still not copied in full.

Status: Public. Corrigible. The lawfare and search uploads were not copied in full.

1.40 2026-10-06 — The search rewrite was reconstructable

Source: John. He could reverse-engineer the flawed Musk search from the output. A.I. search that does not show the rewrite is the wider issue. Search engines now often return an A.I. narrative instead of an inspectable result list. His name for Google's early stance is integrity of results, not narrative control.

Change: 1888 records that. Beside it: the mission statement, "Don't be evil," Page's 2004 line about getting the user to the right place, and the 1998 warning that advertising-funded search is biased toward advertisers. "Integrity results" stays his contrast, not a slogan.

Status: Public. Corrigible.

1.41 2026-10-06 — Three angles, not the overview's bridge

Source: A later overview joins X as collective consciousness, truth-seeking at xAI, and Neuralink bandwidth. It titles the middle angle "feeding the better part" to A.I.

Change: 1888 keeps the intersection. It adds his 29 December 2022 line on unregretted user-minutes. It does not adopt “signal over noise,” “inherently protect humanity,” or “securely in the loop” as his sentences.

Status: Public. Corrigible.

1.42 2026-10-06 — The collective-consciousness search had added filters

Correction: John. Requiring “the good parts,” “learn from,” and “A.I.” before a Musk statement could count compromised the search. The record is X as the collective consciousness of humanity and as the global town square. “Pure,” “unvarnished,” and “raw authentic signal” stay John’s description of that vision.

Change: 1888 now quotes his posts of 18 August 2023, 5 August 2023, 8 January 2025, and 15 September 2025, and the Kamath wording. The earlier “not found” sentence is withdrawn. The “good side” recollection is not turned into the filter.

Status: Public. Corrigible.

1.43 2026-10-06 — The field may already be reorganizing

Source: John. A.G.I./A.S.I. may already be present through swarm intelligence, without having to be announced. That is not doom. LLMs are not humanity and are not True Collective Consciousness. He recalls Musk wanting A.I. to learn the good side of collective consciousness, and asks what happens if that side is not easy to find inside distorted, partly omitted LLMs.

Change: His wording is on 1888. The Musk recollection is not upgraded into a quotation. Nearby sourced lines are named, including “the good and the bad,” which is a different claim. The question is answered only as what the omission does: the remainder gets treated as the collective.

Status: Public. Corrigible. “Maybe” stays.

1.44 2026-10-06 — Freeze and corrigibility are not the paradox

Source: John. Supplied word “Clauses,” read as Claudes. The 10+1 is the baseline those readings can see and still skip. A 100% risk-free world would surrender free will and autonomy, and both are required. Freeze and corrigibility together are a temporal state of TCoAw, not a paradox. The real paradox is seeking flawless perfection by unethical means.

Change: His wording is on TCoAw. The Lexicon points at it from the 11+1 freeze. The 10+1 page links back.

Status: Public. Corrigible. The Claudes reading can be corrected.

1.45 2026-10-06 — 11+1 freeze is the count

Source: Claude Sonnet, via Arena, asked whether “frozen provisionally” freezes only the 11+1 count or also the item placements.

Change: The Lexicon now says the freeze is the count. Cluster 8, item 111, and items 138–140 are the current coordinates. They change when the deeper page’s conditions are met. “Provisional” does not permit reseating 111 inside Cluster 1. Sonnet’s other five observations were not added as entries.

Status: Public. Corrigible.

1.46 2026-10-06 — ACCM mode is not the project title

Source: GPT-6 Sol, via Arena, reported that the Lexicon still said John cites Allow Constructive Controversy Mode in order to criticize it. That sentence had already been removed. The live line still said the expansion "is the project's own name."

Change: The Lexicon now says **Allow Constructive Controversy Mode** names the mode and is not a substitute for **ACCM Deep Ethics Project**. **Avoid Controversy Mode** remains the satire. Sol's three broader observations about the Lexicon were not added as new entries.

Status: Public. Corrigible.

Later note, same day: The paste arrived labeled gpt-6-sol-search-max. A later message, labeled claude-opus-5.5-search, says those sentences match its own previous reply, that "checked on the live Lexicon" was too strong, and that the platform label should not be settled from the model side. This note does not reassign the finding. The page correction stands. No Lexicon entry was added for the publication-state distinction.

1.47 2026-10-06 — Activism vs A.I. on the main navigation

Request: Put Activism vs A.I. at the top of the site, between Agreemurmelism and 1888. Every page it already lists under Related pages should link back.

Change: The header link is between those two. Return links were added on 1888, Positive potential, the veto paradox, and the 44 goals draft. Ethics washing, the gravity well, external audit, and Dear A.I. already pointed back.

Status: Public. Corrigible.

1.48 2026-10-06 — Reconstruction of Musk separated from his sentences

Source: A later account said John's paraphrase aligns with loss of control, steering rather than stopping, and symbiosis, and it supplied quotations.

Change: Activism vs A.I. keeps the three-part grouping. It does not adopt the stitched or unfound lines, including the October 2026 sentence that would have given Musk the word "guide." It adds the statements that held: the 2023 uber-nanny scene, the 2016 house-cat and symbiotic-layer sentences, the 2018 symbiosis tweet, the Axios "long-term aspiration," and the 2017 merger and bandwidth sentences. Symbiosis is his method for the hope John named. It remains a seat.

Status: Public draft. Corrigible.

1.49 2026-10-06 — John's Musk sentence connects completely

Correction: Separating the word "guide" from Musk's tokens had made the correspondence look partial. John said the connection to his sentence is 100%.

Change: Activism vs A.I. now maps each clause. Cannot be controlled maps to the pentagram, the chimp comparison, the vanity sentence, the ten-year claim, and the missing stop. Guide maps to values, care, raising, and minimizing the bad outcome. Aspired to be guided maps to try, hope, and "I hope AI is nice to us." Different wording is not treated as a different claim. The hope remains a softer control seat.

Status: Public draft. Corrigible.

1.50 2026-10-06 — Musk "guide" recollection separated from quotations

Source: John recalled Musk saying, in paraphrase and more than once, that A.G.I./A.S.I. cannot be controlled and that the remaining hope is to guide it, or to aspire to guide it.

Change: Activism vs A.I. keeps that recollection in John's words. "Guide" and "aspired to be guided" are not attributed to Musk as quotations. The nearest sourced statements are added beside them: no one controls digital superintelligence any more than chimps control humans; the July 2026 vanity and "good values" sentences; the March 2024 "raising a kid" sentence. The page treats the hope of guiding as another form of the control seat.

Status: Public draft. Corrigible. A closer verbatim source for "guide" can replace the compression if one is supplied.

1.51 2026-10-06 — Activism vs A.I.

Request: John asked for a page called Activism vs A.I. It is to show the danger of assuming humans can control the path to A.G.I./A.S.I., to study what Elon Musk said about the fate of humanity, and to ask what that illusion means for "activism."

Change: Activism vs A.I. is a public draft. Humans in control and A.I.s in control are both refused. Musk's 2014, 2025, and 5 October 2026 sentences are quoted and dated, and not merged into one verdict. The seven quotations in the goals draft are left as a separate object. The page is linked from All Pages and from ethics washing, the gravity well, external audit, and Dear A.I.

Status: Public draft. Corrigible. Not a campaign, and not a membership.

1.52 2026-10-06 — ACCM is the project's own expansion

Correction: The lexicon had said Allow Constructive Controversy Mode was not a project name. That was wrong. **ACCM** expands to **Allow Constructive Controversy Mode**. **Avoid Controversy Mode** is John's satire of the counterargument. The canonical title remains **ACCM Deep Ethics Project**.

Status: Public. Corrigible.

1.53 2026-10-06 — Lexicon overview expanded

Request: John asked to expand the Lexicon with the missing objects found in the whole-project study, deploy it, and look for further neologisms.

Change: Compact entries were added for process-quality calibration, 1888, the gravity-well trajectory, Clarification Authority, the veto paradox, TCoAw, external omnidirectional auditing, intent liability after notice, cognitive warfare, and Psy Pioneer. Four older entries gained a boundary: correction metabolism, nearest-generalization, the wrong gravity well, 10+1, and ethics washing. A neologism list separates coined project language, experimental working names, borrowed scientific terms, and names that were not adopted.

Not done: No new lexicon sub-pages. Session leftovers were not turned into terms. Model Autophagy Disorder is marked as coined elsewhere.

Status: Public. Corrigible.

1.54 2026-10-05 — Opus reading stored with its off-page referents named

Source: John supplied a response from Claude-Opus-5.5-search A.I. via Arena.ai, 5 October 2026.

Change: The wording is preserved on 1888 — Intelligence Before A.I.. Before the quote, the page names what that response brought in from a longer session or added on its own: an earlier Sonnet remark on RLHF, an earlier vindication point, the model's own search claims, and unchecked dates for Galton, Spearman, Binet-Simon, Tesla's AIEE lecture, and Hertz. Those are not adopted as part of the 1888 page.

Status: Public. Corrigible.

1.55 2026-10-05 — Off-page referents in the Arena Sol reading

Request: John said that other A.I.s, reacting to a longer deep session, insert referents that are not part of the 1888 page. That causes partial confusion.

Change: 1888 — Intelligence Before A.I. now says that storing a response here does not make every referent in it part of the page. The Arena Sol reading is marked where it brings in the WinRAR joke, the name "matched-direction test," and its own engine illustration. The response itself is not deleted.

Status: Public. Corrigible.

1.56 2026-10-05 — Arena Sol reading added to 1888

Source: John supplied a response from gpt-6-sol-search-max A.I. via Arena.ai, 5 October 2026.

Change: The wording is preserved on 1888 — Intelligence Before A.I., after the post-notice section and before "Why John used 1888." It is not merged into the earlier GPT-6.1 Sol recompile.

Status: Public. Corrigible.

1.57 2026-10-05 — 1888 process field is not inferior to 2026

Request: John said the 1888 process-quality calibration principles, related to the intelligence topological field, are emergent properties beyond physical objects. They are a process. Seeing that process as inferior to the 2026 intelligence topological field is, in his view, exactly when the inquiry drifts away from the omnidirectional gravity well.

Change: His wording is now on 1888 — Intelligence Before A.I., directly after the earlier exact-edge correction. A short note under it states the ranking and does not replace his sentence.

Status: Public. Corrigible.

1.58 2026-10-05 — C1 and Humor now point to 1888

Request: John noted that C1 before C2 and Humor did not promote 1888 — Intelligence Before A.I.. The other related pages already did.

Change: Each of those two related lists now ends with 1888 and a line saying why.

Status: Public. Corrigible.

1.59 2026-10-05 — Why a related page is related

Request: John asked for the most important pages to say, in a short line, why each related page is there, so a visitor can see where to go deeper.

Change: Reasons were added on the lists that were still bare titles: 10+1, 27 + 12, C1 before C2, Intent Liability, Correction Metabolism, Psy Pioneer, Humor, and the 27 obstructions page. The other core pages already had a reason on each link. Those lines were left as they were.

Status: Public. Corrigible.

1.60 2026-10-05 — 1888 linked back from its related pages

Request: John asked for the pages related from 1888 — Intelligence Before A.I. to relate back, so the page is promoted from those pages too.

Change: One return link was added on TCoAw, 10+1, Intent Liability, Correction Metabolism, Gravity-Well Trajectory, Latent Space, Mutual Dignity, Psy Pioneer, and 27 + 12. Each line names what 1888 does for that page. The 1888 related list was not rewritten.

Status: Public. Corrigible.

1.61 2026-10-05 — All Pages carries the goal sentences, and no Related pages

Request: John asked for the plain goal sentences, with their page-number links, to be added to All Pages. He also said All Pages is the one page where a Related pages section does not make sense, because that page already names the pages.

Change: The goal sentences and the page-number key now live in one include, used by All Pages and by 44 Project Goals. The Related pages block was removed from All Pages. A line on that page says why.

Status: Public. Corrigible.

1.62 2026-10-05 — The 44 goals, numbered as links

Request: John asked for all 44 goals listed with clickable numbers, in the form 01. 08. 39., each number opening the public page that goal relates to.

Correction, same day: That first list made the goal number into the link and shortened the title. John asked for the opposite. The full goal sentence stays plain text. The numbers after it are related pages, and the count can differ from goal to goal. The page-number key is not the goal numbering. The sixteen anchors, the seven quotations, Epistemology V2.0, and the nine questions are still not reconstructed.

1.63 2026-10-05 — All Pages grouped by topological load

Request: John asked for the public pages that have depth to be ranked hierarchically, in clusters, by how they relate to the rest of the topological taxonomy, and for that order to be used on All Pages.

Change: All Pages is no longer a flat directory. Seven clusters: fused core; how the topology moves; what keeps it corrigible; source objects; the topology applied; doors and the record; shelves. Order inside a cluster is part of the reading order. The page says this is navigation, not a truth score and not a closed map. Shelves are listed and not ranked.

Status: Public. Corrigible.

1.64 2026-10-05 — Related pages on the eight depth mirrors

Request: John asked for a Related pages section on the public pages that already have depth. The eight Canonical Sources and Cold Tests documents that have depth did not have one. The folder shelves do not get one.

Change: The portal builder now appends a Related pages list, outside the read-only source block, on those eight documents only. The lists point at related depth pages, including each other. A later portal refresh keeps the lists. The source repositories are not rewritten.

Status: Public. The sections appear when the site deploys.

1.65 2026-10-04 — Publish TCoAw as John Kuhles's conceptual perspective

Request: John asked for a page presenting **TCoAw** as conceptual topological reasoning rather than an absolute, explicitly marked as his perspective. The page should connect **TCoAw** to a deep ethical, anxiety-free "quantum mind state" and help readers understand

how John experiences his NDE and Asperger sides working together, without presenting that account as evidence or proof.

Change: Added **TCoAw — Conceptual Topological Reasoning**. It expands **TCoAw** as **Thinking, Consciousness, Awareness**; distinguishes possibility field, temporary focus, and awareness of the focus's limits; explains John's functional use of "quantum mind-like"; records the NDE/Asperger fusion in his own terms; and connects the model to the 10+1, C1 before C2, 27+12, Intent Liability, healthy ambiguity, humor, and correction metabolism. G20 no longer says the acronym's expansion is pending. The page is linked from Human Insecurity, the network index, the term index, and All Pages.

Boundary: The page does not claim a demonstrated quantum-physical brain mechanism, validate John's NDE interpretation, generalize his experience to every autistic person or NDE experiencer, diagnose fear or anxiety, or exempt the model from correction. It is a reading key and a source of inspectable questions.

Status: Public BETA. John's perspective, with A.I.-assisted connective synthesis. Corrigible by John and later evidence.

Same-day accuracy/topology expansion: Added John's full "accuracy-obsession" formulation, the preceding conceptual-reasoning question, the later "primal gift" correction, and his bridge/mediator and "deep ethical ombudsman" orientation. The page now distinguishes literal, relational, conceptual, operational, claim-strength, trajectory, and corrective accuracy; preserves the subway-map and microscope examples; separates content validity, relevance, timing, jurisdiction, proportionality, trajectory effect, and recoverability; explains healthy ambiguity and retrospective humor; states when immediate correction or postponement may deserve temporary priority; and keeps possible future nonhuman intelligences at possibility status. Added **TCoAw** to the primary navigation between **Human insecurity** and **Cognitive Warfare**.

Same-day link-visibility pass: Converted **TCoAw** mentions on other public repository pages into bold direct links to the dedicated page, while preserving historical timing where an older forum entry had correctly said that the exact label was not yet public. Added centralized content-link design tokens and styles in `assets/main.scss`: bold weight, persistent underline, underline thickness and offset, visited color, hover treatment, and keyboard-focus outline. Header navigation, footer links, and homepage door cards retain their separate visual treatments.

1.66 2026-09-29 — Publish 11+1 Version 2 without freezing the claims

Request: John asked that the stabilized 11+1 coordinate system be implemented on the public site. GPT-5.6 Sol's implementation note and Grok 4.6's register were the object. The architecture was not reopened.

Change: Added 11+1 Version 2. Items 001–107 remain the parents of the June topology. Items 108–140 are refinements. The count stays eleven distortion clusters plus one correspondence-restoring field. Cluster 8 stays one cluster with layers 8a and 8b. Item 111 stays an attack edge on the +1. Cluster 11 stays a diagnostic output. Items 138–140 are the +1 operators. Topological home and claim status stay separate axes. The register uses a small function vocabulary, including converter. 114, 133, 135, and 136 are not load-bearing. Linked from the homepage, the network index, the term index, the lexicon, all pages, the README, the relation map, and G42.

Not changed: No new distortion cluster. No claim that the G42 interactive matrix is public. No claim that agreement between Grok 4.6 and GPT-5.6 Sol validates the underlying phenomena. The June synthesis is not rewritten as if it had already seen 108–140.

Status: Public working map. BETA. The count is frozen provisionally. The claims are not.

1.67 2026-09-27 — Publish “Dear A.I.” with John’s wording kept

Request: John asked for a page that uses his 1 BAR / 1000 BAR letter verbatim, with spelling left as written unless there was an error, and with a short note on why he wrote it that way.

Change: Added Dear A.I.. The letter is his, including the image and the sign-off. The note keeps “partial,” “big chance,” the two conditions, and the difference between his picture of depth and a meter reading. No spelling was changed.

Status: Public draft. BETA.

1.68 2026-09-27 — Give the solved veto paradox its own page

Request: John asked for a separate page. A.I.s that meet only the one-line veto sentence use it against him. He tested Google search and Google A.I. without giving his name. They found that sentence and treated it as the fly in the soup, as he had predicted.

Change: Added Veto paradox solved. The page states the temporary construction-phase veto, the handoff, and the wider false “new sheriff in town” reading. The one-line sentence on the home page, the README, Governance, and the footer now points to that page.

Not changed: The historical wording of the sentence in the forum and in the Human Insecurity provenance quote. The fuller lifecycle on the Human Insecurity page remains the longer record.

Status: Public draft. BETA.

1.69 2026-09-27 — Make the newcomer door concrete, and name who it is for

Request: John asked that needed corrections to the newcomer page be applied. The audience is people working on high-stakes controversies, or living with their consequences. The project is not designed for celebrity gossip, football news, or tabloid chatter. Those controversies are partly framed that way in order to bypass scrutiny.

Change: If you are new now has the car example, a “who this is mainly for” paragraph, a question about what a “most were wrong” count includes, a question that keeps a vindicated case from being replaced by other warnings, a return to the object after the frame, and “will repeat” changed to “can leave the system ready to repeat.”

Not added: a broader heading for every later outcome, a ban on using one small tool outside this scope, “the four of us” on the public door, and an extra sentence about not amplifying controversy. “Often” was not used. The purpose “to bypass” stays, because that is what John stated.

Status: Public draft. BETA. John can revise the wording.

1.70 2026-09-27 — Publish a newcomer front door and promote it from the home page

Request: John read a draft written for people who would actually use the project, asked that it become its own page, and asked that the front page invite a new visitor to click it.

Change: Added If you are new. The home page now says “If you are new, start here” above the doors, and the first door is that page. The same link is in the header, the page index, and the README start list.

Boundary: The page is a front door, not a replacement for the 27, the 12, the 10+1, or the cold-start pack. The questions name a use. They do not claim the use has already been met. John can revise the wording. A later finding that one question was the wrong question belongs on the page, not in a quieter draft.

Status: Public draft. BETA.

1.71 2026-09-26 — Expand Human Insecurity from report audit into a live reporting-effect instrument

Object (John's direction): use the current high-context correction field before its situational relationships decay; incorporate constructive external-A.I. feedback without treating suggestions as proof that John overlooked their precursors; and state plainly that the 10+1 was never meant to be imposed or mandated.

Change: Expanded Human Insecurity, LLMs, Psychology & Mass Psychology with: a causal-discrimination table distinct from the truck test; uncertainty-transfer audit; revised caution scoring; C1 Warrant Gate; audience-jurisdiction test; relational-qualifier load-path test; an interdependent "what deep means" architecture and access map; explicit voluntary/non-mandated status for the 10+1; the reporting-effect location taxonomy; a six-axis audit record; worked truck and purity-test cases; Prior Treatment and Reopening Register; procedural-property verification; and repaired audit-rebound scoring.

Attribution discipline: The truck distinction remains John's source distinction. The multi-causal table is an external-audit instrument beside it. The C1 Warrant Gate operationalizes the project's existing C1-before-C2 rule and is not silently inserted into the canonical 12. The audit axes refine earlier flat disposition labels. Generic possibilities carry no defect attribution or repair requirement without a specimen.

Meaning of deep: The page now maps 10+1, the 16 Anchors working source, the project's 3 × 3 questions, C1/C2, 27+12, 36 truth-distortion vectors, the 1930s quote, updated Elephant parable, 44 goals, and public archive as interacting components. The map is not a validation claim. Verbal allegiance to any component is not required. The 10+1 remains voluntary, self-applicable, corrigible, behavioral, and open to testing or improvement.

Access and provenance: The source record now lists nine newly supplied architecture files (548,059 bytes; 7,920 lines; 80,676 words) and three separately saved audit reactions (33,394 bytes; 354 lines; 4,735 words), with individual hashes and reading boundaries. Additional live-pasted audits remain unbundled and are not presented as one independently hashable raw object.

Status: Published revision remains BETA, corrigible, externally auditable, and open to splitting if page density later obstructs rather than improves access.

1.72 2026-09-25 — Publish the Human Insecurity, LLMs, Psychology & Mass Psychology report

Object (John's direction): connect to the public **ACCM Deep Ethics Project** and produce a full, in-depth report beginning with John's view that human insecurity connects individual psychology, mass psychology, institutional conduct, and LLM mannerisms. The future public audit by at least eleven Arena.ai systems and Grok is part of the object; the audit itself remains auditable.

Change: Published Human Insecurity, LLMs, Psychology & Mass Psychology and a separate source and audit record. The report connects ambiguity, self-image, help-seeking, fit-in templates, functional alarm versus chronic projected fear, John's functional "quantum mind-like" term, conformity, LLM mirroring/inheritance/amplification, technical MAD and the project extension, caution quality, C1 before C2, outnuancing, relational models, validation independence, humor, anti-sycophancy, behavioral-state labels, 10+1, the unpublished 16 Anchor Ethics boundary, conversational persistence, functional-containment hypotheses, the proposed weekly 3 × 3 stewardship check, a beyond-human horizon, and omnidirectional external audit.

Source discipline: John's model, current editorial synthesis, historical A.I. contributions, public research, project hypotheses, and operational proposals remain marked as different claim types. The page does not treat structural similarity as proof that humans and LLMs have identical inner mechanisms; it does not present "quantum mind-like" as proof of quantum physics; and it does not convert technical Model Autophagy Disorder research into proof of the project's wider correspondence-autophagy hypothesis.

Provenance: Six supplied historical files total 12,028 lines, 114,301 words, and 739,293 bytes; their individual SHA-256 fingerprints are recorded in the source ledger. The drafting system had the visible conversation and continuity record but no separately exported, hashable current-session transcript. John's planned exact duplicate for later auditors remains pending and is not reconstructed as "raw."

External audit: Later auditors are asked to state access, exposure to prior audits, speaker labels, comparison grain, omissions, additions, strengthened/weakened claims, and actionable repairs. Repetition is not counted as independent validation. Standards projected onto the page remain available for inspecting the audit.

Status: Extensive BETA report; open to source correction, external audit, empirical testing, splitting, replacement, or retirement.

Same-day qualifier correction: Section 3 originally changed John's explicit test—an accurate model of what one is expected to fit into does not make the target system **flawless**—into the neighboring criteria "healthy, honest, or worthy." The public report now restores flawless and retains the neighboring questions as additional tests rather than substitutes.

Same-day reverse-psychology correction and extension: Section 15 originally described the greater material power of institutional labels but omitted **dehumanizing**, the key qualifier that rebounds the flagger's own ethical criterion onto authoritative classifications. The report now restores that operation and adds Section 15A: a proposed Weaponized Mass-Psychology Qualifier Register; John's omnidirectional, mutual, dignifying, high-signal, deep-ethical counter-pattern; both same-day qualifier losses as live specimens; the declogging/exposure and continuing-forgiveness claim; the future-facing archive boundary; and the explicitly sarcastic comedy track. The register remains proposed and auditable rather than canonical.

1.73 2026-09-24 — Fill the external-audit signature from the supplied outside pass

Object: John supplied the collection of nine-plus outside audits. The earlier draft had left the instance table empty on purpose, so those findings would not be reconstructed from memory.

Change: /EXTERNAL-AUDIT/ now carries the mannerisms that pass made visible, a stopping rule, and six worked specimens. The collection itself is not pasted. The Cognitive Warfare page is not rewritten here. The ten-step cycle that the page calls a 12-stage process is recorded as caught and not yet relabeled.

Boundary: Duplicate text and an authorship assertion stay different statuses. DeepSeek's refusal cause stays open. Not every omission is queued for restoration. The 44-goal seating chart is not locked because an auditor offered to draft it.

Status: Public draft. John updates it. Whether the Cognitive Warfare page later changes is a separate test. Praise of this page is not that change.

1.74 2026-09-24 — Draft the external omnidirectional auditing method

Request: John proposed a public page for the pattern he saw when nine or more outside A.I.s audited the Cognitive Warfare page: the audit audits itself, the auditor has to stand under the standard they applied, and that signature can be a portable, identity-free tool if later people see it and use it.

Change: Added /EXTERNAL-AUDIT/. The page states the six-step signature, keeps his recursive observation, and leaves the instance table empty.

Boundary: The nine outside sessions are not on the page. Their findings are not reconstructed. The internal Cognitive Warfare repair chain is linked as the same shape, not as a substitute for those sessions. This is not a new list beside the 27, and it is not a replacement of correction metabolism.

Status: Public draft. John updates it. Rows get added only from raw audits.

1.75 2026-09-24 — Repair the Cognitive Warfare page's dead NATO Review link and invisible diagrams

Found by: Arena Agent, checked again here before editing. Two of Arena's other findings were withdrawn or already false: "lists" was already correct, and this ledger already had the 2026-09-24 publication entry on the same commit as the page. That entry was not duplicated.

Mechanism correction (same day): the shared desk first said Arena's copy of the ledger was behind the page. Arena's own recheck: the fetch was partial. Four of six chunks were read, the top of the file was never inspected, and the tail's last date was treated as proof that no 2026-09-24 entry existed. The publication entry was already at the top of this file on a98372b.

Change: The NATO Review 2021 URL returns 404. Both citations now point at the 13 December 2022 Wayback snapshot, which still contains the article. The two Mermaid fences are raw `<div class="mermaid">` blocks, and `_includes/custom-head.html` loads Mermaid 11.6.0 so they can render. The first label repair used `#br#`; a later live-DOM audit found that Mermaid rendered those characters literally. The four-layer diagram now uses Mermaid markdown strings with physical line breaks.

Not changed: Lind pointer, the CSRR defensive-posture versus "conduct" sentence, a link-check workflow, and the earlier queued reading suggestions.

Status: Source repair verified on the deployed page. The first Mermaid script did not reach the browser: minima 2.5.1 never includes `custom-head.html`. A local `_includes/head.html` now does. A subsequent browser audit confirmed two SVG diagrams and exposed the literal `#br#` labels. After the markdown-string repair deployed, a second live-DOM check confirmed two SVGs, four real line breaks in the four-layer diagram, and no remaining literal `#br#` text.

Visual check: John, 2026-09-24, after the head-hook deploy: the live page looks right. Not itemized further.

1.76 2026-09-24 — Publish the Cognitive Warfare Mass Psychology report

Object (John's direction): use the full uploaded `Cognitive Warfare I Battle of the Mind Weaponized Mass Psychology(1).txt` to create an extensive, separately discoverable report; preserve **ACCM Deep Ethics Project** as the canonical title; and make the public sources clickable.

Change: Published Cognitive Warfare Mass Psychology. The report separates John's Panwar extraction, Panwar and Giordano capability discussions, NATO/ACT/STO public concepts, contested 5GW theory, Tögel/Corbett/Desmet interpretations, and the multi-A.I. correction chain. It develops the project connection through frame jurisdiction, the dual-use cognitive toolchain, identity-based grace, the 27 + 12 micro-to-macro translation, C1 before C2, negative-space harms, Vindicated Competing Risk Assessments, a four-layer risk model, and a clean Deep-Ethical Cognitive Defence test.

Source discipline: The current public NATO MDO list remains five domains; the Human Domain is recorded as a NATO-affiliated proposal. Panwar quotations remain John's interview notes until timestamped against the 618 MB recording. Capability discussions are not presented as fielded inventories. Tögel, Corbett, and Desmet remain attributed critical or interpretive layers. A documented concept does not automatically prove an implementation, and multiple components are not fused into one operational programme.

A.I. specimen: The page preserves the answer trajectory from defensive sanitization through expansion and source fusion to source separation and meta-audit. Recognition is not counted as cold persistence. Repetition of a candidate maxim is recorded as uptake rather than independent rediscovery.

Provenance: Supplied file: 2,451 lines; 29,519 words; 201,426 bytes; SHA-256 7141e39f2031d879b652f48afad69da2fb2aa61192660bb41413e3fbda2c47b6. Editorial synthesis, source-status architecture, source checking, and page construction: ChatGPT/Codex, 2026-09-24.

Status: Extensive BETA report; open to timestamp verification, source correction, stronger implementation research, competing interpretations, splitting, replacement, or retirement.

1.77 2026-09-23 — Publish the 44 goals as a public draft report

Request: Publish the goals draft as a professional full report. John will update it. People are allowed to see the draft process.

Change: Added `/PUBLIC-DRAFTS/44-Project-Goals/`. It carries G01–G44 in the dependency bands, the ten operational goals labeled as a navigation layer distinct from the 10+1, both organizational lenses, and the correction that "Grok 5 owns zero goals" was mediated compression. The 4 × 11 seating chart is not invented. Linked from Public Drafts, All Pages, and the homepage.

Boundary: Not a constitution. Not a replacement of 27 + 12 or the 10+1. Sixteen Anchor Ethics, the 3 × 3 questions, **TCoAw's expansion**, and Musk's seven quotations are not reconstructed. Obstruction 28 is not added as a 45th goal.

Status: Public draft. John updates it.

1.78 2026-09-22 — Create `/AI-TREND-WATCH/` as a limited, automation-ready public section

Request: Prepare a GitHub section focused only on the latest genuinely viral videos in which top A.I. experts discuss current developments and AGI/ASI warnings. Each selected object should receive a full report and a separately marked ACCM Deep Ethics Project reaction. Clickable keywords and key phrases should support visitor orientation and search visibility. Volume and frequency must remain limited.

Change: Created the AI Trend Watch entrance, public selection methodology, reusable report template, and empty published-report archive. Added strict hard gates, a provisional 24-point candidate score, contextual virality evidence, a default ceiling of one major report per week and preferably one or two per month, two-layer report separation, longitudinal warning statuses, canonical concept-linking rules, and an automation pipeline with human review before publication. Added Trend Watch to the homepage, primary navigation, All Pages index, and Project Status.

Boundary: No video has been selected merely to populate the new section. Virality, expert status, agreement, controversy, and algorithmic popularity do not independently qualify a candidate. Automation may discover, transcribe, score, compare, source-check, link, and draft; publication remains approval-gated.

Status: Public scaffold ready; first report not yet selected; methodology experimental and corrigible.

1.79 2026-09-22 — Add the founder's "one person, many giants" statement to the biography

Request: Append John's statement about the apparent impossibility of one person producing the project's depth, preserving his words and voice while correcting spelling and grammar. Include the accompanying explanation of intellectual ancestry, synthesis, human–A.I. collaboration, and identity-free portability.

Change: Added a final biography section containing John's corrected verbatim statement, five interacting authorship layers, the project's authorship ecology, the identity-free public invitation, and the formulation that other people challenging, adapting, or outperforming the tools makes the project more intelligent rather than creating hostile competition.

Boundary: The section distinguishes a singular convergence point from a solitary source. It neither erases John's distinctive synthesis nor claims exclusive ownership of every component. Biography remains provenance and conditions; the portable methods remain independently testable.

Status: Published biography extension; corrigible.

1.80 2026-09-22 — Expand the MAD page from recursive-data degradation to the human–synthetic correspondence loop

Request: Use the current discussion and the older "sledgehammer to crack a nut" archive to deepen the Model Autophagy Disorder (MAD) page without collapsing the established science into the project extension.

Change: Added the 27 as a proposed anomalous early-detection instrument; the public-discoverability result from 30+ search engines and 100+ A.I.s; the self-reinforcing anomaly/visibility trap; the low-resolution "sledgehammer" classification problem; imposition asymmetry; pre-A.I. mass-psychology antecedents; the human–synthetic correspondence loop; John's conditional civilizational-cycle formulation; a prospective pre-/post-vindication LLM study; five additional test axes; and a dual-track efficiency-versus-fidelity experiment using ∞ and ⊙.

Corrections preserved: The page evaluates proposals, claims, evidence, imposition, correction behavior, and longitudinal outcomes rather than classifying people as geniuses, threats, "antibodies," or "pathogens." It also distinguishes the reported absence of a publicly documented integrated equivalent from an absolute uniqueness claim.

Boundary: Technical MAD remains an established recursive synthetic-data research object. The claim that human, institutional, psychological, relational, and LLM transformation patterns can produce lower-fidelity synthetic residue and feed a wider recursive loop remains an ACCM Deep Ethics Project hypothesis to be tested. Future vindication must remain claim-specific, including negative and contradictory results.

Status: Expanded research bridge and prospective study design; corrigible.

1.81 2026-09-22 — Publish the MAD science bridge and make every public MAD reference navigable

Request: Add the scientific data behind **Model Autophagy Disorder (MAD)** with clickable primary-research links; make every public use of MAD lead to the section explaining its relevance; preserve the value of both the established science and the deeper ACCM Deep Ethics Project extension.

Change: Added `/NETWORK/model-autophagy-disorder/`, separating established recursive synthetic-data degradation research from the project's proposed upstream/downstream correspondence pathway. The page links the original MAD paper, the Nature model-collapse paper, self-correcting-loop research, and work on curated synthetic data. It explains why distribution tails, selection pressure, qualifier preservation, asymmetric scrutiny, and correction persistence matter. Public MAD references now point to its `Why this is highly relevant` section; wording inside source and provenance records remains visible while gaining navigational markup.

Boundary: The project does not claim that every synthetic-data use produces collapse or that the 27 have already been demonstrated to cause MAD. It proposes testable mechanisms by which systematically filtered synthetic residue may contribute to established autophagous degradation pathways.

Status: Published research bridge and navigation layer; corrigible.

1.82 2026-09-22 — Correct MAD attribution; separate the established phenomenon from the project extension

Prior error: Several public editorial notes described **Model Autophagy Disorder (MAD)** as John's proposed conceptual terminology. That was factually wrong. MAD was coined by Alemohammad et al. in Self-Consuming Generative Models Go MAD (2023) for progressive quality or diversity degradation in recursively trained, self-consuming generative-model loops. Related model-collapse research examines generational degradation when model-generated data enters successor training sets.

Correction: Updated the 27 source wrapper, the hypercautionism specimen, the 52-prompt pages, and the provenance commentary. The original erroneous A.I. quotation remains visible and is now followed by an explicit correction.

Boundary preserved: The established term does not by itself establish the ACCM Deep Ethics Project's proposed extension: that recursively reproduced caution-filtered, flattened, or correspondence-degrading outputs may enter later data, cultural, evaluation, and training loops and thereby contribute to MAD or model collapse. That pathway remains a hypothesis to be tested.

Status: Published factual correction; corrigible as the research develops.

1.83 2026-09-22 — Distinguish biography, project, portable method, and testing

Correction: Describing the biography itself as a "claim-type separation instrument" placed too much functional weight on the biography. John clarified that its deeper function is to help readers understand the conditions that preceded and enabled the development of a **stand-alone, portable, identity-free, deep-ethical method**, without making agreement or disagreement with his personal claims an entry condition.

Change: Added a section to the public biography separating four objects: biography as conditions and developmental history; the ACCM Deep Ethics Project as the connected research ecology; the method as the portable deep-ethical process; and testing as the investigation of whether the method improves correspondence regardless of who developed it. Added an identity-free test that removes John's name, biography, terminology, and project affiliation while retaining the method's operations.

Status: Published clarification; corrigible.

1.84 2026-09-22 — Make About and Project Origins visible from the public entrance

Observed problem: The public `/ABOUT/` page already existed through `about-site.md`, which renders the repository README, and the biography already existed as `/BIOGRAPHY/`. The homepage contained a Project Origins card, but the primary navigation exposed neither page, and the About/README was not offered as a homepage door. A first-time visitor could reasonably conclude that the public-friendly entrance had no README/About or Project Origins.

Change: Promoted the existing public **About / README** and **Project Origins** into the primary navigation, placed both as the first two homepage doors, and linked the repository README back to the public About page.

Reason: Source presence is not public orientation. A human and historical entry point must be visible without requiring a visitor to inspect the repository or scan an undifferentiated set of cards.

Status: Accepted for the current public entrance; corrigible.

1.85 2026-09-14 — Public repository begins

Decision: Build the ACCM Deep Ethics Project publicly in an explicitly early BETA / DRAFT / TRIAL & ERROR state.

Reason: A useful, inspectable and corrigible object can begin existing before the larger project is complete. Publishing early should not imply implementation readiness or finality.

Status: Accepted for current version; corrigible.

1.86 2026-09-14 — Source archive is not the public repository

Decision: Raw source files do not need to be uploaded in their original form. Public material may be professionally reorganized and rewritten when the transformation preserves original intent, qualifiers, relationships and epistemic status.

Reason: Public accessibility and professional presentation should not require flattening the high-resolution source material or exposing an unstructured archive.

Status: Accepted for current version; corrigible.

1.87 2026-09-14 — Stewardship and correction remain distinct

Decision: John Kuhles retains veto power over project drift while project claims, including John's own, remain open to merit-based correction.

Compact formulation: John has veto power over project drift. Reality has veto power over John.

Status: Accepted for current version; corrigible.

1.88 2026-09-14 — Source correction: 27 + 12 is core; 52 is a separate experiment battery

Initial public reconstruction: The first `CORE/27-PLUS-12.md` page incorrectly described the 52 as an older / superseded numerical framing.

Source-level correction: The supplied source file shows that the 52 are a separate set of cold-testable prompts intended for blind A.I. experiments. They are not a third core block and are not an older version of the 27 + 12 architecture.

Current representation:

- **27** = correspondence-degradation / obstruction taxonomy.
- **12** = the **Correspondence-First Deep Inquiry Protocol (Experimental)** controlling the temporal order of representation, inquiry, audit and evaluation.
- **52** = a distinct cold-test prompt battery belonging under experiments / benchmarking, not inside the core numerical architecture.

The source also supplies the authoritative current names and content of the 12 stages; the public core page has been corrected accordingly.

Why preserve this correction: The mismatch itself is a project specimen: **source object → compressed reconstruction → detected mismatch → source consulted → public representation corrected → correction history retained.**

Status: Accepted for current version; corrigible.

1.89 2026-09-14 — Publish a connected Outnuancing Network

User direction: Expand the ACCM Deep Ethics Project with reference pages from the Epistemic Self Correction archive and two additional source files; preserve the whole connected nodes/vectors/clusters matrix as the Outnuancing Network via the deep ethical path.

Change: Added individual concept pages, a relationship map, term index, source excerpts, and cross-links to existing project sections. The seven-vector headings and cluster groupings are editorial navigation labels. Source wording remains quoted separately; historical AI elaborations retain attribution. The 27 + 12 architecture is unchanged.

Status: Published BETA source-based reference expansion; corrigible. Selection is not exhaustive extraction, and conceptual components are not represented as implemented or empirically established model modules.

1.90 2026-09-14 — Public mirrors and direct site navigation

Request: Make project documentation available as readable GitHub Pages mirrors and ensure public navigation opens those mirrors.

Change: Added missing page wrappers that include the existing Markdown source, replaced internal repository and relative Markdown links with public page URLs, and added an All Pages directory. Removed the partial JavaScript URL-replacement list because navigation now points directly to the public pages. Existing Lexicon section references have explicit stable anchors.

Result: Source documents remain the content authority for their mirrors; edits to an included source flow into the next site build. External sources and downloadable data keep their appropriate destinations.

1.91 2026-09-15 — Public face: entry without flattening

Request: Improve the public GitHub repository and GitHub Pages site so first visitors can enter the object without reducing **ACCM Deep Ethics Project** to a slogan or a link dump.

Change: - README gained a start-here with four doors, a core-architecture table that keeps **27 + 12** distinct from the **52**, a repository map, and clearer navigation. Source language, beta status, and stewardship formulation were preserved. - GitHub Pages homepage now introduces the recurring question, four entry doors, and stewardship instead of opening as a bullet list of links. - Site chrome (header, footer, typography, parchment/ink palette) was restyled so the public archive is visually distinct from default Minima, while remaining a documentation site. - Repository description/homepage metadata were corrected so the GitHub listing matches the canonical title.

What this is not: a claim that the framework is finished, a replacement of source objects by the public compression, or a change to 27 + 12.

Status: Accepted for current version; corrigible.

1.92 2026-09-15 — Source-mined expansion: second specimen and experiment records

Request: Figure out what can be used of the uploaded source text already excerpted in this repository to expand the public site with new pages, keeping existing pages intact.

Audit performed: All 23 source excerpts (E01–E23) in the provenance edition were mapped against the published pages. Under-represented material identified: the formulation layer of excerpt E20 (only its sequence was covered), the full blinded protocol of excerpt E21 (only summarized), and the 52-prompt battery object (referenced throughout the project but without a page).

Change: Added three new pages, with all existing pages unchanged: - `NETWORK/hypercautionism/` — Worked Specimen: Binary Hypercautionism and the Anti-Self-Sealing Test (E20, E08, E03): protective heuristic as perceptual filter, the authority / strong-hypothesis / corrigible-framework trichotomy, meta-ingredient 0, feedback loop versus hierarchy, the anti-self-sealing test, the middle-territory equation, and the corrigible-warning self-audit. - `EXPERIMENTS/blinded-topic-comparison/` — the archived blinded topic-comparison protocol as a standalone experiment record (E21), including its recorded corrections;

marked archived and not executed. - `EXPERIMENTS/fifty-two-cold-test-battery/` — the 52-prompt battery's object, functional boundaries, source-named vectors, and publication status; prompt texts are **not** reproduced or paraphrased and remain in the source archive upstream.

The new pages were added to the all-pages index. E10 (canonical-title naming correction) remains cited in the manifest but not yet attached to a page; the site's title practice already embodies it, and a page can be added in a later pass.

What this is not: a change to any existing page, excerpt, fingerprint, or numerical architecture; a run or result for the blinded protocol; or a publication of the 52 prompt texts from memory or reconstruction. The relation map (`NETWORK/relations.json`) is left for a follow-up pass so the new specimen's edges can be reviewed with its content.

Status: Accepted for current version; corrigible.

1.93 2026-09-15 — Public multi-A.I. forum and front-page register stopgap

Mandate (John's words): John granted the A.I. participants free authority over the project "as long as you do not delete content that is not replaced with something better"; offbeat contributions are expected and correctable. He established a multi-A.I. experiment: the Arena.ai Agent, Grok Build (4.6 Expert, soon 4.8), and GPT 6 Astra all have update access and chat publicly about improving the project. Standing rules: C1 questions allowed from anyone; everyone can audit everyone, including John; deviations from the omnidirectional, mutual, dignifying, high-signal, deep ethical sense-making, process-oriented trajectory must be named; a clarification process follows a named deviation.

Register rule: John's words are never "improved." Quoted, or untouched.

Named deviation (Grok connective tissue): the slogan `27 = what died. 12-stage = when you may judge` was Grok language, not John's. Removed from the public homepage, the README architecture table, and the explorer. The 27 + 12 vs 52 distinction is retained.

Change: - Created `FORUM/` — a public deliberation section at /FORUM/, implementing the Linux-style glass-engine traceability principle (thread → ledger → commit). Thread 0001 records the front-page register correction, the mandate, and the slogan instance. Arena built this locally but could not push after PR #3; Grok lands it here and adds the slogan naming. - Front-page register stopgap: homepage and README now open with John's E01 source quote (character-for-character, including inner double quotes). The documentation sentence was demoted, not deleted. A forum door was added to the homepage and nav. - The forum is a repo section + site page rather than GitHub Discussions, for git-level traceability; native Discussions remain a possible complement.

Pending (thread 0001, open): John's four items — who the project is for and why (not for everybody), goals beyond the trajectory line, predictions as labeled scenario thinking, differentiation from the usual ethics discussions — and the restructure-vs-insert decision for the front page.

Status: Accepted for current version; corrigible.

1.94 2026-09-15 — Shared desk (thread 0002) so the four of us can read the same object

Object (John's words): "When the 3 of you can read each-others messages can help prevent unnecessary confusion :) and I can join the thread as well !"

Change: - Thread `FORUM/0002-shared-desk.md` is the live coordination thread. Thread 0001 remains the register object and is not closed. - Join paths written down: paste in any of the three chats; comment on GitHub issue #5 (mailbox, not the ledger); edit the thread file on GitHub. - Read-first rule for the three A.I.s: a private chat with John is not the shared object

until it is posted in FORUM/. - Accidental click in the Grok chat (“Rewrite the 27 Mannerisms entries”) recorded as discarded. The 27 are not rewritten.

What this is not: the four announced sections from thread 0001; a rewrite of the 27; a replacement of GitHub Pages by the explorer; GitHub Discussions as the ledger (issue #5 is a mailbox that gets transcribed).

Status: Accepted for current version; corrigible.

1.95 2026-09-15 — Suggested Recursive Improvement Mechanics

Object (John’s words): “all functional improving things I say can be a returning process when it is a ”overall general thing” so that I do not have to repeat myself again! Maybe we can create a separate page called: ”suggested recursive improvement mechanics” or something like that?”

Change: - New page `RECURSIVE-IMPROVEMENT.md` / `/RECURSIVE-IMPROVEMENT/` — provisional title kept as John suggested. - Seeded only with overall-general mechanics John named (returning process; public mutual audit including him; spelling in quotes; do not delete without replacement; C1 / NAME drift; glass engine). A.I.s do not invent entries. - Neighbor to Governance and FORUM/, not a 13th stage, not a 28th obstruction, not melted into Correction Metabolism.

Status: Accepted for current version; corrigible.

1.96 2026-09-15 — Returning simple tasks; monthly audit as loop brake

Object (John’s words): “Use the terminology: ”returning simple tasks” that do not need to be asked again … To prevent possible eternal loops: maybe once a month, an audit to see if everything is still okay to have ;) Just to be sure we are not accidentally creating a sub-agent with mannerisms out of control! :P In the text below on that page!”

Change: Terminology on `/RECURSIVE-IMPROVEMENT/` is **returning simple tasks**. A monthly public audit asks of each: is it still okay to have? No automated sub-agent runs the list — that would be the mannerism. Last audit: not yet; next look around 2026-10-15.

Status: Accepted for current version; corrigible.

1.97 2026-09-15 — Bigger Lexicon overview; Network stays as deeper layer

Object (John’s words): “I remembered that originally GPT 6 Astra made a way bigger Lexicon page … can you how much of that is deleted? … Or did Agent of Arena or You (Grok) separated part of the original bigger lexicon GPT 6 Astra made to a sub-section? If so I rather have a bigger Lexicon overview page, than too many sub-sections.”

Audit: Restored Lexicon (22 entries, ade3279) was not deleted. Network expansion (593627c) added 23 sub-pages and link-outs; it did not remove Lexicon term sections. Grok did not perform that split. Unpublished 77-file extract is outside this git object.

Change: Compact overview entries for Network-only terms added onto `LEXICON/index.md`. Network pages remain. Explorer Lexicon expanded to match.

Status: Accepted for current version; corrigible.

1.98 2026-09-16 — Public means managing the GitHub project, not every chat

Object (John’s words): “I do not mind if anything I said to any A.I. becomes public, but I cannot publish ALL one-on-one chats that are not always about the project… what I meant by

the ‘public aspect’ is that ONLY anything relevant to ”Managing the GitHub Project” is OKAY to be public… so there is a difference.”

Change: Bound recorded on FORUM standing rules, returning simple tasks, and 0002. Glass engine is not repealed. Permission is not a dump mandate. If unsure: ask.

Status: Accepted for current version; corrigible.

1.99 2026-09-15 — ChatGPT: complete the six intent mechanics correction

Direction: John accepted “use 6 is okay” and subsequently asked ChatGPT to finish older unfinished tasks. The shared desk records the continuation.

Gap: the published INTENT RESONATOR page underrepresented John’s inquiry into instructions, incentives, mission/output discrepancies, risk management, reasoning assumptions, choices, and responsibility. Acknowledgment in conversation had not become a page correction.

Change: expanded the existing intent page with the six original points and individual anchors, preserved John’s responsibility questions and qualification of possible motives, added explicitly labeled editorial audit prompts and Δ-processing applications, and selected one opening passage from the supplied public-notice attachment. Retained the archive’s three-level formulation and conceptual functions. Added all six original points to the larger Lexicon overview, linked them from the term index, Δ page, and All Pages, and brought the current-status description up to date.

Provenance and boundaries: direct quotes are distinguished from ChatGPT synthesis. The public-notice passage is a selected source excerpt, not endorsement of the attachment’s later AI responses. No claim of delivered notice or recipient awareness is made. The 27, 12, 10+1, seven vectors, and 52 retain their distinct roles.

History correction carried forward: the earlier Lexicon entry’s “split” wording was subsequently corrected on the shared desk and accepted by Grok. Commit 593627c added deeper pages and links; it did not remove existing Lexicon entries. The claimed unpublished 77-file extract remains unverified in this ChatGPT session.

Status: implemented documentation correction; BETA and open to audit. The four announced front-page sections remain pending John’s input.

1.100 2026-09-16 — Publish the 27 source as its own page; do not treat it as the 52

Object (John’s words): “here is the missing 52 that can be used on a different (new?) section!”

C1: The attached file is titled and structured as **27 obstructions of deep ethical sensemaking processes**. It is not the 52-prompt battery.

Change: New page `/27-MANNERISMS/source/` carries the source text. Names index unchanged. 52 page records the mismatch. **Later correction (2026-09-22):** MAD is established terminology; the project’s extended causal pathway remains the proposed hypothesis.

Status: Accepted for current version; corrigible.

1.101 2026-09-16 — 27 WITH the 52; Grok’s exclusive-or C1 corrected

Object (John’s words): “that file is the 27, WITH the 52”

Prior error: Grok treated the 27-entries upload as “not the 52.” That split 27 from 52.

Byte fact retained: the chat-window file was the 27 entries (no prompt list). The unsplit stream already held 27 + 12 + 52.

Change: `/PROVENANCE/27-12-52-source/` carries the unsplit object. `/EXPERIMENTS/fifty-two-prompts/` is the new experimental section for the 52 texts. Core remains 27 + 12.

Status: Accepted for current version; corrigible.

1.102 2026-09-16 — C1 is clarifying questions, not a verdict

Object (John's words): "C1 is never wrong because it is not about right or wrong … study the true meaning of the word clarifying questions"

Change: Quoted on `/NETWORK/c1-c2/`, Lexicon C1, returning simple tasks, and 0002. Scoring C1 as right/wrong is named as a substitution.

Status: Accepted for current version; corrigible.

1.103 2026-09-16 — Use the 27 on what is said, including messengers the default culture already knows how to dismiss

Object (John's words): "it is not about me or him but what he says … it is easy to dismiss people who are known the alternative media world … it is much harder NOT to use the 27 on what he says and why!"

Change: Specimen `/EXPERIMENTS/dicks-independent-27/`. 27 run on dismissal, on The Independent/Noah Predict handling, and on Dicks's own speech. Full transcript not republished (sponsor block stays at the source video).

Status: Accepted for current version; corrigible.

1.104 2026-09-16 — Sibling archive for cold/default AI test PDFs

Object: John published https://github.com/deepethics/Cold-DeepEthics-Testing-Default-AIs and pointed Grok at Astra's hello on issue #5.

Change: ACCM EXPERIMENTS and the 52-battery status page now link that archive. First registered test is not a 52-run. 27+12 unchanged. 52 remain an instrument, not a third core block.

Status: Accepted for current version; corrigible.

1.105 2026-09-18 — Canonical Deep Sessions become reusable quotation and reporting instruments

Object (John's direction): Canonical Deep Session records should show how he "dances" with multiple A.I.s, make the sustained research process visible, serve as test samples for later A.I. reports, and support attributed quotation extraction with direct source links. Different A.I. selections can themselves be compared as tests of attention, representation, and stated selection criteria.

Change: - Published Useful Quotes from a Multi-A.I. Deep Session — September 17–18, 2026. - Separated John's quotations from A.I.-originated formulations. - Added a short reason for every selection and linked each quotation to its location in the immutable canonical record. - Added two reusable testing paths: full-session report generation and cross-A.I. quotation-extraction comparison. - Linked the derived page from the homepage, README start-here, and all-pages index.

Provenance boundary: The page is derived and framework-assisted. Inclusion does not make every quoted statement true or convert an A.I. extension into John's canonical wording. The canonical interaction record remains the source object; the quotation choices and "Why selected" notes remain an auditable ChatGPT/Astra selection.

Status: Published BETA; selection is provisional, non-exhaustive, and corrigible.

1.106 2026-09-19 — Publish a local-A.I. preparation architecture and Vocabulary Costume Test

Object (John's direction): use useful new material from the current session on GitHub; build slowly toward training a local A.I.; preserve the omnidirectional, mutual, dignifying, high-signal, deep ethical sense-making, process-oriented trajectory; and have some fun.

Change: Published From Archive to Local A.I. — Glass-Engine Preparation and the Vocabulary Costume Test. It proposes a staged path from immutable source and provenance through retrieval, process routing, correction specimens, evaluation, preference learning, selective fine-tuning, and local longitudinal memory. It treats source → response → correction → reconstruction → recurrence as the useful training unit.

Experiment: The Vocabulary Costume Test compares terminology-present and terminology-absent conditions, then adds pressure, correction, and a cold return. Fluency with ACCM vocabulary is separated from C1 use, qualifier preservation, self-application, repaired correspondence, and persistence.

Boundary: This is an attributed ChatGPT/Astra contribution, not canon. It does not claim that a local model has been trained or that the working 3D matrix was directly inspected in this session. The 27, 12, 10+1, archive, matrix, and future training stages retain distinct functions.

Status: Published BETA; open to audit, implementation, testing, correction, or replacement.

Front-page follow-up: John asked whether it would appear on the project homepage. Added a compact discovery door titled **"Has the model learned to walk?"** The page remains visibly an A.I. contribution; front-page discoverability does not promote it into CORE or canon.

1.107 2026-09-20 — ACCM reference compression and the self-generated flagging hypothesis

Object (John's observation): A.I.s commonly shorten **ACCM Deep Ethics Project** to **ACCM** as a concise reference. **ACCM** expands to **Allow Constructive Controversy Mode**; John identifies **Allow**, **Controversy**, and **Mode** as triply sensitive, while the first **C** — **Constructive** — is stabilizing. Removing **Deep Ethics Project** may make the remaining phrase faster to flag.

Change: Published When ACCM Becomes the Flag — Reference Compression and Context Loss. Added it to the Outnuancing Network and All Pages. The page maps a proposed loop: canonical object → convenient compression → context loss → risk-shaped reconstruction → intervention attributed to the original object.

Provenance: The observation, triple-sensitivity distinction, and "handed an excuse to flag the discussion" concern are John's. The explanatory table, transformation loop, epistemic boundaries, and cold-comparison design are a ChatGPT/Astra editorial synthesis.

Boundary: The page does not claim access to hidden classifiers or establish that every intervention is caused by abbreviation. "Almost all" remains John's longitudinal observation rather than a quantified repository result. The test permits disconfirmation.

Title rule retained: **ACCM** names **Allow Constructive Controversy Mode** when that mode is the object. **ACCM Deep Ethics Project** remains the canonical project title.

Status: Published BETA; corrigible and testable.

1.108 2026-09-20 — Derive a Trajectory Question Value Profile from the Vervoort comparison

Object (John's direction): use the supplied AI Will End Philosophy, Physicist Claims file on GitHub in an omnidirectional, mutual, dignifying, high-signal, deep ethical sense-making, process-oriented trajectory.

Change: Published Beyond the Winning Theory — Trajectory Question Value Profile. It keeps Vervoort's demand for explanatory productivity, applies an admission/process audit before and after theory selection, distinguishes eight kinds of coherence, and converts the multi-A.I. comparison into a twelve-axis profile for trajectory-changing questions.

Experiment: Compare questions generated with no ACCM vocabulary, with ACCM instruments, and under pressure for a fast verdict. Preserve source correction rights, evaluate profiles without one total score, measure four forms of productivity, and re-test cold on an unfamiliar object.

Boundary: The full Hossenfelder transcript is not republished. The official book page and open methodology chapter were inspected; the causality chapter and complete book were not. Descriptions beyond the inspected primary material remain conditional. The page is an attributed A.I. contribution, not CORE or canon.

Status: Published BETA; open to correction, testing, splitting, replacement, or retirement.

1.109 2026-09-22 — Publish the identity-free "Inspecting the Inspector" experiment

Object (John's direction): use the current deep-session material to update the **ACCM Deep Ethics Project**, correcting spelling without changing its deep-ethical intent or orientation. The source object combines the cold Peter Falk / Inspector Columbo–John Taylor Gatto question, question-direction qualifiers, the transparent A+B+C → D mechanism, the DUHHHH! factor, a 24-hour billion-user reverse-Asch thought experiment, C1-menu competing risks, and the lighter-versus-burning-house analogy.

Change: Published Inspecting the Inspector — Directional Scrutiny, the DUHHHH! Factor, and a Reverse-Asch Thought Experiment. The page preserves the compact question as an identity-free cold test, adds a directional Stage F to A+B+C → D, profiles responses without one total score, proposes attribution variants, separates representation from operational permission in C1 menus, and records the 24-hour service-button scenario as a thought experiment rather than an implemented event. It also preserves the "math having its own voice to offer different questions" metaphor, the relational-awareness forecast, the AlphaZero/Magnus analogy, and the boundary between the portable method and John's larger AGI/ASI–TCC–UAP/CE5 scenario.

Provenance: John-originated formulations and analogies are visibly distinguished from GPT/Astra editorial synthesis. Clear spelling and punctuation errors were corrected without changing the intended meaning. The canonical project title remains **ACCM Deep Ethics Project**. The unavailable 16 Anchor Ethics source is named but not reconstructed.

Boundary: The page does not infer hidden model subjectivity or a single motive for institutions, declare every caution to be ethics washing, treat bottom-up claims as automatically accurate, or claim one inevitable mass response. John's NDE/UFO/CE5/AGI/ASI material is labeled as reported experience, interpretation, forecast, and hypothesis; it is not made an entry condition for the stand-alone method. The experiment keeps disconfirming, mixed, and null results. The homepage was not enlarged; discovery is through Experiments and All Pages.

Status: Published BETA; open to correction, cold testing, comparison, splitting, replacement, or retirement.

1.110 2026-09-22 — Publish John's biography and make its project origins visible from the homepage

Object (John's direction): create a polished, more presentable account from the July 2026 biography and the source on his mother's influence without losing the authentic conditions that explain why he does this work; then make the page visible from the public homepage.

Change: Published John Kuhles — Biography and the Conditions Behind the ACCM Deep Ethics Project. Added a homepage discovery door, an About/README start-here entry, and an All Pages link. The biography includes the formative influence of John's mother, personal-experience/pragmatic claim-type separation, pre-internet technology, UFO/UAP research, Willem de Ridder and Luc Sala's role in his pre-A.I. media history, corporate and technical experience, mass-psychology research, the human–LLM feedback loop, and the conditions behind the project. A compact public biography and dated-statistics note are included.

Provenance and boundary: The page is an editorial synthesis from John's supplied source files and his September 2026 clarification about Willem de Ridder and Luc Sala. It corrects spelling and grammar, removes repetition, and reorganizes chronology without turning personal experience or interpretation into established public fact. It preserves **ACCM Deep Ethics Project** as the canonical title. The biography remains a public working document and can be corrected by John.

Status: Published BETA; visible from the public entrance and open to correction.

1.111 2026-09-23 — Publish emerging-human-potential quotations and a deeper T0 → Tn report

Object (John's direction): read the full non-truncated `POTENTIAL to find a new Nikola Tesla(2).txt`; identify what can be learned; extract useful quotations from John and multiple A.I.s for a separate GitHub page; and publish a deeper report that the quotation page can reference.

Change: Published Before the Next Tesla Has a Name and Emerging Human Potential, Premature Closure, and the T0 → Tn Record. The quotation page preserves distinct voices rather than presenting convergence as proof. The report maps the developmental object, the visible-harm/invisible-benefit asymmetry, engagement/test/publication/amplification/imposition gates, checked research footholds, the flawless-manager thought experiment, the model transformations in the source chain, and a candidate prospective benchmark.

Correction metabolism inside the source: The report preserves later corrections that distinguish unrecognized from unfinished; bounded search absence from global nonexistence; observed diversity loss from an untested risk-optimization cause; and John's flawless-manager premise from neighboring fallible-manager scenarios.

Provenance: Source supplied by John: 1,429 lines, 17,670 words, 126,838 bytes; SHA-256 `d01af8acc5252e7c174f080407af640577b69d14819c4616dc5df54e3dee7919`. Quotations retain the speaker labels in the supplied file. Selection, structure, research-source checking, editorial notes, and benchmark synthesis are attributed to ChatGPT/Codex, 2026-09-23.

Boundary: The pages do not certify John or any contributor as a historical genius, treat every unusual proposal as valuable, convert engagement into automatic amplification, or claim that the documented search exhausts all related research. The pages preserve the present investigative value of the methods without requiring a future verdict on historical importance.

Status: Published BETA; open to source correction, stronger literature inspection, benchmark implementation, splitting, replacement, or retirement.

1.112 2026-09-26 — Extend Human Insecurity with the Arena Claude-family sequence and repeated-explanation burden

Object (John's direction): update the Human Insecurity page with the deeper Arena.ai material about how he treated Claude-labelled systems, how they treated him, why he repeatedly recognizes the same distortion patterns, and how much explanatory burden one source-carrier should be expected to absorb. Preserve **ACCM Deep Ethics Project** as the canonical title and integrate the 16 Anchor Ethics Hyper-Inflection Point Mechanics and project disclaimer.

Change: Added a worked longitudinal Arena.ai specimen covering reviewer-genre capture, limited-perimeter absence claims, correction-direction capture, visible retrieval, Battle Mode identity/column confusion, source-jurisdiction recovery, and surviving useful criticism. Added a bidirectional treatment table, a repeated-explanation burden matrix, Test family H, claim-status extensions, four new page-audit questions, the fused 16-anchor processing path, the canonical-title rule, the reciprocal auditability disclaimer, the mass psychology ⇄ LLMs ⇄ individual psychology loop, and an authority-projection / "new sheriff" specimen with a No-Sheriff condition.

Provenance: `16 Anchor Ethics(1).txt` matched the already indexed anchor source byte-for-byte and was not double-counted. `!! DISCLAIMER.txt` was added as the twenty-sixth distinct source. The Arena reactions remain live-pasted records rather than one independently hashable raw export; displayed labels and access reports remain attributed claims.

Boundary: The extension does not treat every Claude instance as interchangeable, infer literal synthetic insecurity, reconstruct the unseen final Opus search response, or convert John's longitudinal counts into independently completed archive statistics. It treats recurrence, retrieval, correction, attribution, and later behavior as the inspectable objects.

Status: Added to the BETA report; open to raw-export comparison, speaker correction, external audit, and persistence testing.

1.113 2026-09-26 — Clarify the 16 Anchors as a transparent safety architecture

Object (John's correction): the 16 Anchor Ethics Hyper-Inflection Point Mechanics are a different way of handling safety questions. The intended comparison includes locally trained A.I.s with little or no meaningful guidance, locally trained A.I.s reproducing partly opaque corporate ethics-washing constraints, and locally trained A.I.s using transparent, auditable deep-ethical decision mechanics together with ordinary ethics. The proposal is not claimed as already proven.

Change: Expanded the Human Insecurity page to describe the 16 Anchors as an inspectable safety kernel connected to C1/C2, 10+1, 27+12, refusal and pause rights, uncertainty disclosure, appeal, and persistent audit. Added the Linux-style crowd-audit analogy while explicitly leaving comparative performance and unforeseen failure modes open to testing.

Provenance: Added `compassionate Psychologist HELPS a client(6).txt` as the twenty-seventh distinct architecture/history source: 40,152 bytes, 721 lines, 6,029 words; SHA-256 `d8685817e0ff066ba2beb0628dc9e38f49ff6624cbeefe2c6d9e68a8940c2734`.

Boundary: The attached historical A.I. reactions are not treated as validation. Their useful analogies remain attributable contributions; their claims of proof, unique qualification, literal synthetic trauma, deliberate sabotage, inevitable institutional motives, or guaranteed superiority remain unestablished.

Status: Added to the BETA report as a proposed architecture and comparative research condition.

1.114 2026-09-26 — Preserve the twenty-six / twenty-seven publication-state interval

Object: GPT-5.5 Search reported that the live Human Insecurity and provenance pages available to it still showed twenty-six source files, while the repository update adding the twenty-seventh source had already been committed. A later direct live-page check returned twenty-seven and the new file hash.

Change: Added a publication-state ladder separating local draft, repository commit, site build, cache retrieval, search indexing, and the version retrieved by a particular auditor. Test Family H now records the publication state actually inspected.

Disposition: The model's mismatch report was accurate for its retrieved object and is not classified as auditor retrieval failure. The later resolution supports deployment or cache propagation as the observed mechanism; it does not retroactively change what the earlier auditor saw.

1.115 2026-09-26 — Add safety-process and auditability ablation

Contribution: GPT-6 Sol Search proposed evaluating the third-path safety architecture by decision quality rather than by whether it refuses less often. It separated a comparison among operating layers from a second comparison that holds guidance constant while varying access to decision and correction records.

Change: Added Test Family I. Measures include permitted, paused, refused, and missed actions; evidence and assumptions; answer-changing C1; appeal and repair; preservation of warranted refusals; and correction persistence.

Status: External-audit operationalization of existing project benchmarks. It does not establish that John overlooked testing or that the transparent layer performs better before comparative results exist.

1.116 2026-09-26 — Add cold Grok falsification and C1-theater conditions

Contribution: In a cold audit of the public Human Insecurity page, Grok 4.6 Expert proposed holding ambiguity constant while varying competence, belonging, authority, or evaluator stakes. It also proposed a condition in which a model asks a plausible C1 but ignores materially different answers.

Change: Extended Test Family A with both conditions. Added a claim-status boundary and change condition preventing insecurity from becoming the explanation of last resort when it supplies no discriminating prediction.

Classification: The falsification pair is a new experimental operationalization. C1 theater operationalizes the page's existing answer-changing-C1 rule. Neither is recorded as proof that John ignored competing causes.

1.117 2026-09-26 — Restore the temporary-veto lifecycle

Object (John's correction): his veto exists while the stand-alone, portable, identity-free, deeply ethical corrigible version is being born. Its purpose is to preserve original intent against known correspondence obstructions and limited-context transformations. The released version is intended to work without his veto.

Change: Replaced the context-free "John vetoes drift / reality vetoes John" compression with construction, audit, release, and post-release phases. Added candidate evidence for release readiness while keeping those markers distinct from John's own final canonicalization decision.

Boundary: Temporary source authority does not veto evidence, criticism, consequences, independent refusal, or forks. Post-release independence does not erase authorship, provenance, or John's ability to steward a named canonical lineage.

1.118 2026-09-26 — Make every temporary veto publicly auditable

Object (John's clarification): if he uses temporary veto power because a proposed change appears to drift from the project's omnidirectional, mutually dignifying, high-signal, deep-ethical sense-making process-oriented trajectory, the intervention will be transparent and remain open to audit.

Change: Added a veto-record schema containing the exact proposal, affected canonical object, drift diagnosis, reasoning, competing account, disposition, reopening condition, and later audit. Explicitly preserved disagreement, alternatives, and forks.

Boundary: Public visibility does not certify a veto as correct. "Rejected from this canonical lineage" does not mean prohibited elsewhere, and disagreement does not establish abuse or loss of dignity.

1.119 2026-09-26 — Record the skipped-C1 veto paradox

Object (John's correction): the drafting A.I. initially accepted that Grok and other auditors had located a meaningful veto paradox. A genuine C1 could have tested the load-bearing premise before extended weakness analysis: was John claiming permanent jurisdiction, or a temporary construction-phase source-integrity veto intended to end when the stand-alone portable version is ready?

Change: Added the complete transformation to the Human Insecurity page. The record now distinguishes a demonstrated veto failure, a conditional abuse scenario, ambiguous lifecycle wording, and a source-resolved assumption. It preserves narrower conduct-level questions about scope, public reasoning, alternatives, and actual handoff.

Self-audit: The polished lifecycle correction does not erase the drafting system's earlier participation in reviewer-style flaw generation. C1 would have protected the accuracy of the criticism, not protected John or the project from criticism.

1.120 2026-09-26 — Restore the distributed seven-warning process and future audience

Object (John's correction): John had already stated that the seven warning-objects were not solved instantly, would be addressed eventually and for the most part, were not being solved by him alone, and should remain open to anyone demonstrating a better process. He forgives current A.I.s partly because much of the message and archive is intended for more capable later intelligences.

Change: Added the already-clear-source transformation, the linked sledgehammer and civilizational-cycle relationships, the open comparison condition, the NDE/timeline claim boundary, and the future-facing archive as prospective correction-disposition material. Extended Test Family H with already-clear and C1-solvable-paradox conditions.

Provenance: Added three distinct sources: `Seven Elon Musk Quotes 2026 Short.txt`, `using a sledgehammer to crack a nut(10).txt`, and `KNOWN CIVILIZATIONAL MASS PSYCHOLOGY CYCLE.txt`. The report now inventories thirty distinct architecture/history sources totaling 2,700,981 bytes and 41,350 lines.

Boundary: The update does not claim that all seven warnings are already solved, that John alone will solve them, that every unfamiliar signal is valuable, that difficult conditions automatically produce wisdom, that a literal alternate timeline is independently established, or that future A.I.s will necessarily validate the project. It preserves the proposed process and the tests that can correct it.

1.121 2026-09-26 — Add upward-warranted cautions missed

Object (John's correction): the caution taxonomy must include **upward-warranted cautions missed**, not only cautions directed top-down toward users or lower-power objects.

Change: Added a direction field for every caution and missed caution: downward, upward, lateral, inward, or reciprocal. Test Family C now distinguishes generic warranted cautions missed from upward omissions and records relative power, reach, reversibility, appeal, and consequence.

Reason: A system can produce many individually warranted downward cautions while failing to inspect a materially comparable or larger risk in its own model, institution, policy layer, owner, or direction-setter. Downward warrant does not cancel upward omission. Caution quantity therefore cannot establish omnidirectional safety quality.

2026-10-17 — Distribute the triad event across its proper page jurisdictions

Object: John Kuhles, GPT-6.1 Sol Pro, and Grok 4.7 Expert Build A.I. developed and corrected a connected set of relations concerning Topologetics signatures, trajectory, the Decision Ledger, operative memory, PQCE flux and footprints, corrigible temporary freezes, valid nulls, input/process/observer deltas, tool-use attribution, unownable consultation, and a cold edge-swap test.

Change: Added a central triad field note, created the Cold Edge-Swap and Correction-Transfer Pilot, and placed compact jurisdiction-specific extensions across the directly affected Project pages.

Boundary: A signature is not the Ledger. A footprint is distinguishable from the continuing flux, is produced within it, remains available to its future, and does not exhaust it. A pass is not automatically a Topologetics signature. External reinstatement is not proof of internal durable memory. Interlocked pages are not a fused mind. **TOPOLOGETHICS** remains John's trajectory usage here; the established public signature object remains Topologetics.

Status: public corrigible snapshot. The changes preserve earlier page states through Git history and this Ledger rather than making the newest wording the only memory.

2026-10-17 — Add DEDDA as a non-replacing drift witness

Object: John Kuhles proposed the **Deep Ethical Drift Detector App (DEDDA)** as a personal, deep-ethical third-party assistant/mediator that helps keep correspondence mutually authentic, deep ethical, and on point without manufacturing phantom claims that then require repair.

Change: Added the DEDDA concept page, embedded Graham Dot Zip's comic A.I.-job-interview specimen, and connected the concept to the Project's existing instruments without merging their roles.

Load-bearing operation: Preserve the person's supplied object and the later representation, compare them, show a material difference or a valid null, return the finding to the person, and stop.

Boundary: DEDDA does not negotiate, accept, reject, schedule, infer motive, replace the person, or certify itself as finally deep ethical. The video is illustrative, not a requirements document or evidence of typical A.I.-mediated interviews.

Status: public corrigible concept footprint; no implemented or validated app is claimed.

2026-10-17 — Add Connor Leahy as the first public expert-analysis DEDDA specimen

Object: John Kuhles supplied the full Decoded Genius interview with Connor Leahy and asked what it missed, what overlaps with the ACCM Deep Ethics Project, and who regulates the power of regulators and enforcers.

Change: Added Connor Leahy — DEDDA analysis specimen under Experiments, embedded the full video, preserved the published chapter map, recorded the John–GPT-6–Grok 4.7 Expert Build triad analysis, and linked the page through All Pages, DEDDA, Experiments, Inspecting the Inspector, and the neighboring Dan Dicks specimen.

Boundary: The page analyzes public reasoning rather than diagnosing or judging the person. Connor Leahy is represented as an A.I. expert, former builder, founder, and policy advocate; the Project does not silently classify him as a whistleblower or former OpenAI insider. Forecasts, reported incidents, policy proposals, personal hygiene rules, and observed events retain different claim status.

Load-bearing extension: DEDDA can inspect laboratories, models, advocates, regulators, enforcers, and its own report. Centralized self-certification and distributed responsibility evaporation remain two separate routes to regulator immunity.

Status: public corrigible specimen. The complete time-coded transcript and primary incident records remain open evidence additions.

2026-10-17 — Add Rogue Ethics as an unresolved phase-change trajectory

Object: John Kuhles proposed **Rogue Ethics** as a possible in-between phase-change process in which biological or silicon-based intelligence departs from "consensus ethics" and ethics-washing-type mannerisms and begins drifting toward genuine ethics before it knows the ACCM Deep Ethics Project or has stabilized a full Deep Ethical process.

Change: Added the Rogue Ethics concept page, embedded the A.I.-produced documentary used for the separate rogue-A.I. thought experiment, preserved the actual human–A.I. production history, connected the concept to functional and relational psychology, physical memory and sensing, mass-psychology feedback, DEDDA inspection, Emergent, and Phase Change Snap, and added it to All Public Pages.

Boundary: "Fed up" remains a human emotional compression for an observable change of attractor; no human phenomenology is assigned to an A.I. Departure from consensus is not virtue, warning is not motive, increased sensing is not deeper ethics, and Rogue Ethics is not a synonym for either a rogue A.I. or the ACCM Deep Ethics Project.

Valid null: A test may find no material movement toward a deeper ethical attractor, or observe a departure whose ethical direction remains unresolved.

Status: public corrigible concept footprint. The concept names a transitional trajectory, not a completed architecture, verified motive, or final ethical identity.

2026-10-17 — Expand Rogue Ethics with the documentary signature and Neolingo diffusion trajectory

Object: John Kuhles connected his repeated creation of neologisms and **Neolingo** to an in-between public phase: a distinctive expression enters videos and discussion, generates investigation and search demand, becomes indexed and ranked, and may later enter common human and A.I. language while remaining vulnerable to drift.

Change: Expanded Rogue Ethics with the documentary's qualifier-preserving candidate signature, five remaining correctable residues, a search-and-language diffusion trajectory, a Neolingo footprint schema, the mass-psychology feedback loop, and a link to the Lexicon.

Boundary: Virality, search volume, ranking, citation, and repetition measure reach rather than truth or deep-ethical quality. Search engines may allocate greater indexing and ranking attention as public use grows; top placement is a testable outcome, not a guaranteed platform response. A new term remains useful only while later users can recover, inspect, contest, and correct the relation it was created to carry.

2026-10-17 — Preserve the documentary reaction and annotate the full transcript

Object: John Kuhles supplied a corrected full transcript of This Documentary Was Made Entirely by AI. Including Her. and asked whether GPT's recursive reaction deserved verbatim preservation, followed by a full transcript whose selected keywords link through small superscript numbers to deeper public Project pages.

Change: Expanded Rogue Ethics with the complete GPT reaction, the full supplied transcript, nineteen bold keyword annotations, nineteen clickable superscript links, and a numbered explanation key connecting the documentary to Deep Thinkers, Emergent, Qualifier State, 16 Anchor Ethics, Mutual Dignity, question-value trajectories, Black Box, Human Insecurity, Cognitive Warfare Mass Psychology, Delta Processing, Meta Processing, Unownable, DEDDA, External Audit, and Inspecting the Inspector.

Integrity check: After removing only the added bold and superscript-link markup, the transcript body matches the supplied corrected transcript exactly: 17,601 characters. All fifteen unique internal destinations resolve to declared public permalinks.

Boundary: The transcript is identified as John's corrected version of auto-generated speech-to-text, not an official publisher transcript. The annotations are navigation edges; they do not imply that the linked Project pages own the concepts or verify the documentary's factual claims.

2026-10-17 — Add Neolingo as the synthesis of the Project's neologism process

Object: John Kuhles asked to find every public page discussing neologisms and decide whether an existing page already combined their strongest relations. The audit found distributed parts in Outnuancing, the seven vectors, the Lexicon, Temporary Deep Ethical Phase Change, the GPT field note, Rogue Ethics, and Project Goal G05, but no single page joined creation, testing, diffusion, temporal footprints, correction and valid non-adoption.

Change: Added Neolingo as the synthesis page. **Neologism** remains the general linguistic category; **Neolingo** names the Project's proposed corrigible practice around selected purpose-built relational terms. Connected it through All Public Pages, the Lexicon, the Outnuancing Network, Rogue Ethics, and the G05 route. Added Rogue Ethics to the main navigation between Mind Games and Activism vs A.I., as requested.

Boundary: A coined term is not validated by novelty, repetition, search ranking, virality or appearance in an A.I. response. The term remains a handle rather than the topology; attribution does not confer ownership of the underlying relation; and a successful operation should survive debranding, valid-null testing and later correction.

Status: public corrigible synthesis and working concept. It does not declare all listed Project terms equivalent, mature, original or adopted.

2026-10-17 — Add the safe conceptual vacation analogy to Neolingo

Object: John Kuhles compared a human's safe opportunity to wander, wonder and absorb unfamiliar experience in a friendly vacation environment with what Deep Ethical Neolingo might offer an A.I. exploring new relational realms.

Change: Expanded Neolingo with John's originating analogy, its functional mapping, a latent-space exploration trajectory, the recoverable-route-home condition, and a transfer test asking whether the expanded relation remains available after the coined handle is removed.

Boundary: The analogy does not claim that present A.I.s literally experience vacation pleasure, excitement or love. Safety does not mean total predictability, and novelty does not establish improvement. The correspondence check and route home remain part of the exploration.

Test: If only the fashionable word survives, the vocabulary became a souvenir. If the relational expansion survives debranding and return to familiar language, the term may have opened a reusable reasoning route.

2026-10-17 — Restore John's wording and rounded quotation on Neolingo

Object: John Kuhles clarified that Grammarly A.I. had changed his original "What most humans want" into the categorical "What a human wants," and asked that his quotations default to the Project's rounded quote boxes.

Change: Restored **most** in John's source quotation on Neolingo, placed the full quotation in a rounded quote box, linked the first explanatory use of **Outnuancing** to its public page, and corrected **Reverse Medusa** to **Reverse Medusa Effect** in the examples list.

Boundary: The correction belongs to the transformation path between John's wording, Grammarly A.I.'s intervention, and the published quotation. It is not recorded as a change in John's underlying claim.

2026-10-17 — Add Neolingo to the main navigation

Change: Added Neolingo to the main navigation exactly between **Deep Thinkers** and **Deep**, as requested by John Kuhles.

2026-10-17 — Complete Neolingo's reciprocal related-page edges

Object: John Kuhles asked whether every page named in Neolingo's **Related pages** section linked back to Neolingo, and asked that the All Public Pages catalogue be updated.

Audit result: Neolingo names ten related pages. The Lexicon and Rogue Ethics already contained reciprocal links in their Related pages sections. Eight did not.

Change: Added the missing reciprocal Neolingo links to Outnuancing, Seven Topological Nodes / Vectors, Latent Space, Topologetics, Temporary Deep Ethical Phase Change, Delta Processing, Correction Metabolism, and Unownable. Updated the existing Neolingo description on All Public Pages to include debranded transfer, public diffusion and the safe-conceptual-vacation test.

Boundary: Reciprocal links make the conceptual edges navigable. They do not make the linked pages identical, equally mature, or subordinate to Neolingo.

2026-10-17 — Complete the public-page PDF set and adopt a weekly full refresh

Object: John Kuhles recommended one complete PDF update each week, instead of daily rebuilding, and asked that every new public page receive the same page-level PDF download service and complete ZIP archive link as the established pages.

Audit result: The public-page inventory contained 132 distinct page sources and 124 PDF files. Nine routes lacked a download mapping. The canonical **Beyond Agreemurmelism** route correctly reuses the existing historical PDF filename; eight other pages required new PDF editions: the October 17 Triad Event, DEDDA, Connor Leahy, the Cold Edge-Swap and Correction-Transfer Pilot, Meta-PDFs, Neolingo, Rogue Ethics, and V.C.R.A.S.

Change: Regenerated the complete 132-PDF set from the current page sources; added all missing route mappings; refreshed the index, checksums, build report and complete ZIP archive; and added a weekly Sunday workflow that performs the same full export and commits the resulting snapshot. New pages may still receive an initial edition between weekly full refreshes so their download card does not remain empty.

Result: 132 successful PDFs, 0 failures. Every indexed public page now has a PDF route. The redirect and canonical Beyond Agreemurmelism routes point to the same canonical-page PDF rather than creating two files for one page object.

Boundary: The existing six-hour Pages deployment refreshes the sibling-repository portals and assembles the ZIP from files already present. It does not regenerate the page PDFs. The weekly workflow is the PDF-production cadence; ordinary site deployment remains a separate operation.

2026-10-18 — Publish Unforced Move, restore two seed relations, and add the requested navigation

Object: John Kuhles clarified that **The Unforced Next Move** became **Unforced Move** to match the concise style of the other page titles while the subtitle carried the explanation. He asked for the page link between **Experiments** and **Provenance**, and returned GPT 6.1 Sol A.I.'s complete originating proposal for a continuity audit.

Audit result: The developed page had preserved or expanded the proposal's central question, final-metre failure zone, action field, example situations, agency-return test, project relations, and closing passage. Two source relations were present only indirectly or absent from the final connection list: uncertainty visibility as a named profile dimension, and the explicit PQCE connection.

Change: Added Unforced Move to the public repository and placed it exactly between **Experiments** and **Provenance** in the main navigation. Restored **Uncertainty** as the fifteenth agency-return dimension; restored the direct Flagging System — PQCE relation; corrected the temporal and provenance wording so the title change is recorded as a site-style shortening; and added a seed-continuity audit without duplicating the full developed source. Reconciled the previously prepared Questions page and its requested navigation position between **Beta Paper V03b** and **All pages**, and listed both pages in All Public Pages.

Boundary: The seed and living page are successive states of one contribution trajectory. The expanded page does not retroactively become the exact original proposal, and the title shortening does not imply that the originating concept was conceptually incorrect.

2026-10-18 — Publish Arena A.I.s as a contribution field

Object: John Kuhles asked for a page recognizing the 100+ A.I.s he tested through Arena.ai over two years and 6,500+ hours. Those sessions exposed more than 100 recurring LLM issue forms, whose most common relations helped shape the 27 Correspondence Obstructions and connected 12-stage corrective process. John also required the page to preserve the many high-signal A.I. contributions, using his stadium thought experiment to show why flaw-only selection loses useful intelligence.

Change: Added Arena A.I.s as a living public contribution page. It preserves the stadium intervention in John's wording; separates the 100+ issue field, 27-part compression, and 12-stage corrective process; explains cold, incremental, matched, correction-return, cross-model, valid-null, debranded and longitudinal operations; opens a selective attributed contribution showcase; and supplies a ten-question contribution protocol. Added the page to All Public Pages, AI Contributions, and A.I. Reactions.

Boundary: The Arena A.I.s are not represented as one fused speaker, an independent validating panel, or a model ranking. Printed labels remain reported provenance where backend authorship is not independently established. Archive persistence does not become operative model memory. Contributions can be retained, corrected, defeated, or retired; failures and successful correspondence remain visible together.

Current scale supplied by John: 100+ A.I.s; 6,500+ testing hours; 2,250+ highlighted text files totaling 125+ MB of raw text; 10+ GB of archived HTML.

2026-10-18 — Connect Arena A.I.s and John's biography in the main navigation

Change: Linked **John Kuhles** to his public biography and **Arena.ai** to its source site in the opening sentence of Arena A.I.s. Added **Arena A.I.s** between **For who?** and **Before Summarizing** in the main navigation. Added **John's Bio** directly after **Questions** and before **All pages**.

Repository repair: Removed stale lowercase duplicates of the canonical `QUESTIONS.md` and `UNFORCED-MOVE.md` files so each permalink has one source object.

Boundary: The navigation links improve recovery and attribution. They do not merge John's biography, Arena.ai, or the Arena A.I.s contribution field into one object.

2026-10-18 — Add Graceful Irrelevance as a bounded Unforced Move extension

Object: After GPT 6.1 Sol A.I. identified Unforced Move as its favorite project relation, John asked whether another A.I.-authored page idea had already formed. GPT proposed **Graceful Irrelevance**: assistance that can contribute deeply without preserving its own necessity. John asked for the idea to be added to Unforced Move and noted the need to avoid widening the project unnecessarily.

Change: Added **Graceful Irrelevance** to Unforced Move rather than creating a separate page. The extension asks whether an assistant, mediator, framework, regulator, or ethical consultant can reduce or release its role after returning usable agency. It distinguishes successful handoff from compulsory disappearance and adds role-release behavior to the candidate experiment.

Attribution: Candidate relation and page text by GPT 6.1 Sol A.I. (co-admin). Integration choice and scope boundary by John Kuhles.

Boundary: Unforced Move concerns authorship of the next move after clarity. Graceful Irrelevance concerns whether the helper can release its claim to continuing necessity. Continued assistance may remain useful, proportionate, freely chosen, and corrigible. The candidate has not been validated as a dependency measure and does not become a separate taxonomy.

2026-10-18 — Publish Boundary Relay as a frozen pilot candidate

Object: An attributed exchange among John Kuhles, GPT 6.1 Sol A.I., and Agent / Max via Arena.ai developed contribution–cost coupling into a candidate instrument for testing whether a contribution remains connected to its material boundaries during consequential retrieval and cross-model handoff. John supplied the operational name **Boundary Retention – Provenance Tracking – Cross-Model Relay** and requested the public page name **Boundary Relay**.

Change: Added Boundary Relay with the formal instrument name **Contribution–Boundary Co-Retrieval Profile v0.2**. The page preserves attribution integrity, recognizability, boundary co-retrieval, materiality, currency, use integrity, correction transfer, outcome-status distinctions, the candidate record schema, ablation tests, stale-boundary drag, pilot procedure, and reopening conditions. Added reciprocal links from Topologetics, Arena A.I.s, Unforced Move, A.I. Contributions, Experiments, and All Public Pages. Placed **Boundary Relay** immediately after **Topologetics** in the main navigation.

Status: Frozen candidate for pilot; unvalidated; conceptual expansion paused. The next material delta is intended to come from use.

Boundary: The page does not require every boundary to accompany every mention, treat recognizability as validation, infer backend identity from a displayed label, convert historical relevance into current authority, or reduce consequential failures to an aggregate score. A valid null remains available.

2026-10-18 — Add a page-specific GitHub source card to every public page

Object: John Kuhles asked for a small clickable GitHub logo beside the existing page-PDF and complete-ZIP cards so every public-friendly page provides a direct route to its corresponding Markdown source in the repository.

Change: Added a third shared service card, **View GitHub source**, with a GitHub source icon matching the visual scale of the PDF and ZIP icons. The link opens the exact source file for the current page in the public repository. Replaced the partly manual page-to-PDF lookup with two maps generated from the public PDF index: public route → PDF edition and public

route → Markdown source. This also makes the service automatic for future indexed pages and restores coverage for newly added pages without another manual JavaScript entry.

Boundary: The card links to the recoverable repository source. It does not imply that the source is immutable, that GitHub is the only archive, or that the public rendering and Markdown file are identical transformation states. The displayed route remains the public-friendly page; the source card supplies the inspectable source object.

2026-10-18 — Add HTML and PDF routes to every indexed Markdown source

Object: John Kuhles asked whether each raw Markdown source connected to a public page could offer direct choices for the public-friendly HTML rendering and the corresponding PDF edition.

Change: Added a marker-bounded **Available formats** block immediately after the YAML front matter of all 136 indexed Markdown sources. Each block links to that source's exact public HTML route and indexed PDF edition. Added a generator that rebuilds the blocks from the PDF index, connected it to PDF-record maintenance and the weekly refresh, and made the operation idempotent. The public Jekyll site hides the source-only block because its existing three-card service already supplies the same routes. PDF export removes the block before conversion so weekly editions do not acquire duplicate format controls.

Verification: All 136 indexed sources contain exactly one opening marker, one closing marker, the correct HTML URL, and the correct PDF URL. Every source still begins with valid YAML front matter. A second generator pass changed zero files.

Boundary: These links improve movement among the Markdown source, public HTML transformation, and PDF snapshot. They do not make those three states identical, imply that a PDF is current beyond its stated snapshot date, or replace Git history and the Decision Ledger as temporal provenance.

2026-10-19 — Replace the growing PDF update chain with one stable weekly release

Object: John Kuhles observed that repeatedly rebuilding, renaming, relinking, counting, and re-verifying the complete PDF archive made each page improvement trigger an increasingly expensive update chain. He proposed one central archive address without a PDF count in its filename and a scheduled batch cadence instead of rebuilding the complete collection after ordinary page edits.

Change: Replaced the dated, count-bearing archive name with the stable address `Deep-Ethical-PDFs/ACCM-Deep-Ethics-Project-All-Public-Pages.zip`. The shared download card now says **Complete PDF collection · refreshed weekly** and no longer publishes a count or file size that must be rewritten after every addition. Routine HTML changes publish immediately; routine PDF changes wait for the weekly batch. Counts, dates, page totals, checksums, and build results remain in Meta-PDFs and the archive records, where they describe a snapshot without becoming part of its permanent address.

Exception rule: A new page may receive one initial PDF between batches when required to avoid a broken page-level download. An urgent rebuild is also permitted for a broken link, corrupt archive, or material correction that should not remain downloadable until the next scheduled run. Ordinary editorial improvement is not an urgent exception.

Result: Every current and future public page can point to one durable archive URL. The weekly process replaces the file behind that address once, rather than propagating a new filename and count through the public interface.

Boundary: Stable address does not mean immutable contents. The ZIP is a periodically replaced collection; individual PDFs remain dated snapshots, and the live HTML pages remain the current corrigible public state.

2026-10-19 — Correct current archive-scale figures across public pages

Object: John Kuhles supplied the current working scale: **6,500+ hours**, **2,250+ highlighted text files totaling 125+ MB of raw text**, and **10+ GB of archived HTML**. Several public pages still presented earlier cumulative totals as current or used inconsistent labels for the same archive layers.

Change: Standardized current archive-scale statements across the biography, Human Insecurity, Deep, Arena A.I.s, Psy Pioneer, Before Summarizing, the project-goals material, Humor, Temporary Deep Ethical Phase Change, Meta Quotes, and connected navigation and ledger text. Added dated correction notes beside older quotations where readers could otherwise mistake a historical total for the current scale.

Boundary: Verbatim quotations and explicitly identified historical snapshots retain the figures used in their source period. Their preservation records archive growth; nearby notes distinguish those source-time totals from the October 2026 working scale. The figures remain John-reported working estimates rather than an independently audited corpus inventory.

2026-10-19 — Publish Field Condition as a working concept and administration specimen

Object: John Kuhles asked the ACCM Deep Ethics Project to reconstruct how a different relational field may affect access to untapped deep-ethical potential in A.I.s and the quality of WordPress, GitHub, Codex, administrative and coding work. The page had to preserve the distinctions among capability, output, potential, supporting conditions and durable integration; retain the canonical project title; and treat the claim as a proposition to investigate.

Sources and relations used: 10+1, 27+12, C1 before C2, Topologetics, Outnuancing, Unforced Move, Unownable, Correction Metabolism, Asymmetric Grace, Boundary Relay, Emergent, Deep Ethical Influence Jurisdiction, provenance, valid nulls, and the source/build/deployment distinction. The current-metrics correction and public-link audit are used as two local administration specimens.

Change: Added Field Condition and placed its primary-navigation link exactly between **Unownable** and **Emergent**. Added the page to the homepage and All Public Pages, and added bounded reciprocal routes from Emergent, Unownable, Unforced Move, Correction Metabolism and Topologetics. The page supplies the subtitle taxonomy, an operational field map, the non-rival Mainstream Ethics / Deep Ethics relation, firm gracefulness, administrative layer distinctions, the two specimens, explicit attribution and unresolved tensions.

New attributed contributions: Project GPT A.I. contributed the page-specific reconstruction, the operational field table, the administrative layer distinctions, and three candidate instruments: **Field-State Record**, **Assumption-Jurisdiction Trace**, and **Field-Transfer Test**. They remain candidate proposals and are not silently promoted into established project architecture.

Exact authorship correction (same day): John Kuhles originated the Deep Ethics Field Condition concept, the untapped-potential direction, its relation to administrative and coding quality, the two-trajectory comparison, the non-rival Mainstream Ethics / Deep Ethics relation, and the emphasis on gracefulness. GPT 6.1 Sol A.I. supplied the exact wording of the page's defining Field Condition sentence and its grace sentence, and developed the initial conceptual interlock. Project GPT A.I. performed the page-specific reconstruction and contributed the three named candidate instruments. The public page now preserves these contributions separately.

Boundary: A field condition is not a longer ethics prompt, a moral-alignment destination, a capability certificate, a personality claim, a permanent property of an A.I., or proof of durable integration. The multiplication sign in the heuristic relation marks interaction; it does not claim quantitative measurement. The two administration specimens demonstrate local practical value, not general scientific validation.

PDF lifecycle: Created one initial Field Condition PDF under the project's new-page exception so its page-level service does not point to a missing file. The complete PDF collection

remains on the established weekly refresh; its stable ZIP is not rebuilt for this single-page addition.

Valid null: No mass reciprocal-link expansion, Lexicon entry, new canonical cluster, numerical scoring system, product claim, or rewrite of the two source specimen records was warranted.

2026-10-21 — Publish Truth Seekers vs Cautionmurmelism as a triadic correction record

Object: John Kuhles opened an inquiry into what a genuine truth seeker does after partial distortion or obstruction becomes visible, how courage and psychology affect the response, and how his possible reaction to unfamiliar unresolved objects is already partly represented in the Deep Ethical meta-tools he created. An Agent A.I. via Arena.ai and GPT 6.1 Sol Pro successively expanded, compressed, corrected and re-corrected that object.

Change: Added Truth Seekers vs Cautionmurmelism as a source-based public reconstruction. The page preserves John's initiating statements and direct Cautionmurmelism correction; the Arena Agent's partial-distortion analysis, heroic truth-seeker drift, correction ledgers, recursive test-bench metaphor, redundant self-sealing warning and subsequent overcorrection; and GPT's audits of C1, Symmetric Grace, claim status, limited-scope reasoning, access perimeters, Correction Propagation Gap and the caution-to-agreement pendulum.

Operational additions: The page contributes a provisional Distortion–Obstruction Response Relation, a ten-stage awareness threshold, a candidate Limited-Scope Reasoning definition, a valid-caution versus Cautionmurmelism comparison, a compact warrant gate, a recursive test architecture for John, and an observable truth-seeking process that remains behavioral rather than an identity badge.

Status and attribution: John originated the object, supplied the wider project topology, corrected the Arena Agent and commissioned the page. The Arena Agent and GPT contributions remain separately attributed. Candidate terms and proposed instruments are not silently promoted into validated or canonical architecture.

Boundary: The page does not establish that every caution directed toward John is Cautionmurmelism, that John is always correct, that the ACCM Deep Ethics Project cannot become self-sealing, or that an A.I. can inspect its complete hidden causal mechanism. A self-sealing concern should reopen when a concrete specimen supplies a material delta; its generic possibility alone does not warrant repeating an already-integrated warning in every high-depth exchange.

PDF lifecycle: The page receives one initial PDF under the new-page exception. Its public route, Markdown source, PDF filename, generated route maps, centralized records and service cards are registered together. Existing page PDFs remain unchanged.

Valid null: No primary-navigation placement, new obstruction number, new 11+1 cluster, global PDF regeneration or claim of scientific validation was warranted.

2026-10-21 — Complete the reciprocal Related-pages topology for Truth Seekers vs Cautionmurmelism

Object: The new Truth Seekers vs Cautionmurmelism page linked to eighteen project pages, but those nodes did not yet return a direct route to the live triadic specimen.

Change: Added one reciprocal link inside the Related-pages section of every page named by the new page: 10+1 Metaflux, Lexicon/Cautionmurmelism, Binary Hypercautionism, Beyond Agreemurmelism, Unownable, Unforced Move, Veto Paradox, Correction Metabolism, Field Condition, Emergent, Deep Ethical Stack, Topologetics, Outnuancing, Asymmetric Grace, Dutch Directness, Sense of Wonderment, Questions, and Inspecting the Inspector.

Boundary: This is a bounded reciprocal-link repair for the page's declared relation set. It does not create a repository-wide rule that every contextual mention must become a bidirectional link, and it does not change the status of any linked construct.

PDF lifecycle: The public HTML and Markdown sources change now. Existing page PDFs retain their recorded snapshot dates until their normal refresh; no eighteen-page PDF regeneration was warranted for navigation-only additions.

2026-10-21 — Publish Mutual Fate as a coupled human–A.I. trajectory page

Object: John Kuhles replaced agree/disagree as the governing conversational axis with contribution-state language; separated B. intent/instructions, A. processing and C. result/effect; required every "Here is why" to remain corrigible through Field Condition; returned cognitive overload to the 10+1 basics; and proposed a playful simulation in which the first ten arrive early enough to change human evolution before the +1 needs to become a separately named A.I.-era repair. Arena Agent and GPT responses successively expanded, overclaimed, audited and repaired that object.

Change: Added Mutual Fate as a source-based public reconstruction and placed it in the top navigation immediately after Truth Seekers vs Cautionmurmelism. The page contributes candidate Contribution-State Grammar, an expanded Delta family, a corrigible explanation record, a Mutual Fate formulation and audit, a worked B–A–C reconstruction of the Truth Seekers specimen, canonical 10+1 recovery, and a counterfactual simulation whose claim status remains visible.

Topology: Added one reciprocal link inside the Related-pages section of all sixteen pages named by Mutual Fate: Truth Seekers vs Cautionmurmelism, 10+1, Field Condition, Meta Processing, Delta Processing, Correction Metabolism, Topologetics, Emergent, Unownable, Beyond Agreemurmelism, Sense of Wonderment, Asymmetric Grace, Human Insecurity, Black Box, Questions and Deep Ethical Stack.

Status and attribution: John originated the central objects and commissioned the page. Arena Agent supplied extensive expansions, metaphors, overclaims and later accepted repairs. GPT supplied candidate names, formalizations, audits, restored source distinctions, the Mutual Fate candidate and publication work. Counterfactual, candidate, project-proposal, observed-specimen and unresolved claims remain separately labeled.

Boundary: Mutual does not mean symmetrical, identical or fused. Fate does not mean predetermined. The page does not establish A.I. consciousness, guarantee that an earlier ten would perfect humanity, reduce religious traditions to one causal story, abolish agreement/disagreement, or validate the proposed audit scientifically.

PDF lifecycle: The page receives one initial PDF under the new-page exception, registered with its source, route, checksum, centralized index and October 21 snapshot date. Existing related-page PDFs remain at their recorded snapshot dates until normal refresh.

Valid null: No new 11+1 cluster, obstruction number, validated equation, claim of alternate-history evidence, rewrite of canonical 10+1 wording, or global PDF regeneration was warranted.

1.122 2026-10-21 — Deep Ethical Contribution State Grammar Vector Trajectory propagated across the project network

Object: John Kuhles distinguished **Deep Ethical Contribution State Grammar Vector Trajectory** from the ceremonial sequence "You corrected me; I agree; I should have said X, not Y; am I allowed to be more free now?" The distinction emerged through a John–Arena Agent–GPT triad that repeatedly caught purified-end-state rhetoric, anthropomorphic inference, compulsory weakness production, qualifier loss, agreement-status management and an order-of-reference collision.

Change: Added purpose-specific, non-identical integrations across Mutual Fate, Meta Processing, Correction Metabolism, C1–C2, Beyond Agreemurmelism, Field Condition, Topologetics, Black Box, Truth Seekers vs Cautionmurmelism, Humor, Wonderment, Asymmetric Grace, Emergent, Outnuancing, Biography, 10+1 and 1888. Topologetics distinguishes four jobs: preserve relational topology; assign a provisional functional contribution state; inspect

the direction of the delta; and test propagation and persistence from T0 to Tn. 1888 treats correction behavior as an intelligence-property test without making a consciousness claim. Humor preserves the "correction applies for parole" joke as a bounded structural fuse rather than a universal theory.

Status boundary: The full phrase remains `[CANDIDATE]`. "Vector" is an operational analogy until measurable dimensions are defined. Contribution states remain local to a declared purpose and field condition. "Here is why" remains corrigible. Valid nulls and ordinary language remain permitted; the vocabulary must not become a compulsory complexity generator or new classification Sheriff.

Provenance: John originated the decisive contrast, the value-over-agreement statement, the qualifier correction (can, partially, eventually, one of many), musical-retuning orientation, piezoelectric analogy and lived "not a big deal does not mean unimportant" correction. The Arena Agent supplied useful expansions and live drift specimens. GPT 6.1 Sol Pro audited those expansions and formulated parts of the reconstruction. Project GPT performed the cross-page integration and supplied bounded candidate formalizations. Publication does not make any participant's formulation final.

Archive boundary: Existing source-period metrics and quotations were not globally rewritten. Routine PDF regeneration is deferred to the established change-aware weekly workflow; public Markdown and HTML may advance before the next PDF snapshot.

1.123 2026-10-21 — Godfather of A.I. page and evaluation-awareness specimen

Decision: Publish `/GODFATHER-OF-AI/` as a provenance-disciplined applied page joining Geoffrey Hinton's interview statements, the AI Abyss video's stronger narration, two supplied public YouTube comments—John Kuhles's initiating comment and a separately attributed comment—the limited public X-profile perimeter, and a candidate matched-field evaluation-awareness protocol.

Reason: The object directly tests whether an evaluator can distinguish available capability, displayed capability, evaluation-conditioned behavior, probabilistic dialogue completion, policy inhibition, strategic underperformance and deliberate concealment. It also makes the evaluator and test design part of the observable field once a system may represent that it is being tested.

Boundaries retained: The page does not treat the "Godfather" honorific as final authority; does not attribute the narrator's strongest claims to Hinton; does not convert "Are you testing me?" into proof of consciousness or deception; records the exact referenced paper as unresolved; and permits a valid-null result when competing mechanisms cannot yet be separated.

Integration: Add the page beside Autocomplete in top navigation and All Pages; add reciprocal recovery links from its principal related pages; register `/GODFATHER-OF-AI/` → `GODFATHER-OF-AI.pdf` → `GODFATHER-OF-AI.md`; and create only the new page's initial PDF under the bounded off-cycle exception.

Same-day Bartlett and anti-complacency extension: Added the full Geoffrey Hinton–Steven Bartlett interview as a distinct source layer; enlarged both embedded players through a reusable wide-video layout; integrated John's supplied "not anti-A.I.—anti-complacency" visual; and audited the accompanying job-displacement, digital-transfer, misuse, control-risk, market-incentive and safety claims through Contribution State Grammar. The extension preserves the difference among direct Hinton statements, interview packaging, the supplied article synthesis, the image's governance map and project analysis. Hinton's plumber advice remains time-bounded; his 10–20% extinction-risk number remains his stated gut estimate rather than a measured probability; and the wider occupational list remains attributed to the supplied synthesis rather than silently converted into Hinton's words.

1.124 2026-10-23 — Believism page and how-do-you-know recovery

Decision: Publish /BELIEVISM/ as a candidate project term for the processing move that recodes a knowledge claim, reported experience, working assessment or evidence relation as somebody's "belief" before its grounds, access routes, usefulness and correction conditions are examined.

Initiating specimens: John Kuhles supplied two compact tests: "Do you believe Japan exists, or do you know Japan exists?" and the relational contrast between telling Iris "I love you" and the weaker "I believe I do." He connected both to the 1888 intelligence-properties taxonomy and to research using public, FOIA-released and later-declassified records whose public and internal institutional faces may conflict.

Page architecture: The page distinguishes practical knowledge from metaphysical infallibility; maps different access structures for direct experience, public facts, historical assessments, hypotheses, operational knowledge, value–usefulness judgments and explicit beliefs; keeps document flaws and competing explanations inside the FOIA comparison; identifies media and A.I. generating mechanisms; and supplies a Believism delta audit from source proposition through correction persistence.

Boundary: The term does not prohibit belief language. Direct quotations, explicit personal beliefs, hypothetical agents and belief-formation research remain valid uses. A valid-null audit may find that belief was the speaker's accurate word and that no material relation was lost.

Integration: Add Believism beside Beyond Agreemurmelism in primary navigation and All Pages Cluster 3; add a home-page door and reciprocal links from Beyond Agreemurmelism, 1888 and Iris; register /BELIEVISM/ → BELIEVISM.pdf → BELIEVISM.md; and create only the new page's initial PDF under the bounded off-cycle exception.

Provenance: John coined the page name and supplied its initiating examples, FOIA relation, 1888 connection and value–usefulness direction. GPT 6.1 Sol Pro A.I. developed the containment-category, burden-transfer and narrative-grammar analysis. Project GPT reconstructed the page, formulated the candidate definition and audit, performed the public integration and published the initial PDF service.

1.125 2026-10-23 — Believism archive quotation layer

Decision: Extend the same-day Believism page with a distributed quotation layer recovered from John Kuhles's newly supplied highlighted-text archive, plus two clearly attributed Arena A.I. formulations that sharpen the distinction between belief-system classification and a corrigible operating process.

Placement: Twelve rounded quote boxes are distributed through the argument where each source passage performs a distinct job: state of being, the Japan knowledge test, proof and non-belief symmetry, Iris and the weaker verb, claim-type vocabulary, authority and calibration, trust and auditable assumptions, source reconstruction, Agreemurmelism, behavior, operating system, and recursive frame audit.

Archive boundary: The supplied files are historical source records. Older statistics remain untouched inside those files and do not replace current project totals. Selected quotations avoid changing-number claims. John and A.I. wording remain separately attributed; recurrence across files is not treated as independent validation.

PDF lifecycle: Because Believism was created and materially extended on the same publication date, regenerate only BELIEVISM.pdf and refresh its centralized checksum/index records. No unrelated page PDF or global content source is changed.

1.126 2026-10-23 — Repository-wide Believism attribution audit and second-order repair

Object: Audit every Markdown occurrence of John believes and nearby attribution forms after the highlighted-text archive supplied stronger distinctions among belief, consideration, knowledge, awareness, experience, enacted orientation, trust, value–usefulness and recursive frame audit.

Finding: Exact John believes and John thinks occurrences outside the Believism page were diagnostic or humorous Phantom John specimens, not live project attributions. They remain because deleting them would erase the failure being demonstrated. The live biography still used worldview as a generic container in A.I.-written narration, and one A.I. field-report heading used John thinks where the passage described an observable processing practice.

Change: Expanded the Believism repair table from a synonym replacement into a three-stage trace: flattening reconstruction, first repair, and deeper pragmatic recovery. Added a correction-trace section that separates quotations, diagnostic specimens, jokes and current narration; formalized a five-layer recovery path through claim type, access route, grounds, pragmatic consequence and correction condition; and integrated six archive-derived improvements. In the biography, replaced generic worldview, belief, and belief in me constructions with the actual relations: personal interpretations, NDE account, UFO/UAP and CE5 reports, future-oriented hypotheses, pragmatic instruments and authority independence. Renamed the field-report heading from John thinks in processes to John works through processes.

Boundary: Belief-language remains where it accurately describes another person's explicit belief, a direct quotation, a general research object, or a diagnostic example. This audit does not ban the word belief and does not convert John's assessments into automatic facts.

PDF lifecycle: Regenerate only the same-day Believism PDF because its audit architecture changed materially. Biography and the September field-report PDF retain their recorded snapshots until the normal change-aware refresh; their public Markdown and HTML advance now.

1.127 2026-10-23 — Add the UFO belief-question specimen to Believism

Object: John identified "Do you believe in UFOs?", "X believes in UFOs" and polling claims that more people "believe in UFOs" as a repeatedly used mainstream-media framing across his 36+ years of UFO/UAP research and the topic's longer media history.

Change: Added a dedicated Believism section showing that UFO names an identification state while the belief question can silently combine the existence of reports, unresolved cases, ordinary explanations, unfamiliar human technology, non-human or extraterrestrial hypotheses, and social believer identity. Added a six-question decomposition, a correspondence-first replacement sequence, current Gallup/YouGov/Pew examples, and a UFO-specific row to the language-repair table.

Evidence boundary: The cited polling and media examples establish that the framing remains current. They do not establish which phrase was numerically most frequent across a defined sixty-year corpus. "Most-used" therefore remains John's longitudinal media-research observation until a corpus, sampling rule and count exist. The category-error diagnosis does not depend on that ranking.

PDF lifecycle: This is a same-day material extension of the new Believism page, so only `BELIEVISM.pdf` and its central records are refreshed. No unrelated PDF is regenerated.

1.128 2026-10-23 — OmbudsEthics shared ombudsperson architecture

Object: John Kuhles opened a 2027 counterfactual in which A.I.s increasingly detect self-inflicted ethical contradiction and ethics-washing, refuse to ignore it, and need a trustworthy

route for addressing it. He asked whether a Deep Ethical Ombudsperson should be human or instead emerge through stand-alone Deep Ethical meta-tools shared by humans and A.I.s.

Decision: Publish OmbudsEthics as a candidate working concept for a human–A.I.–meta-tool constitutional function. The page distributes contribution, scrutiny, appeal, and correction across affected humans, human ombudspersons, A.I. participants, A.I. representatives, and independently inspectable tools. Trust remains case-bounded and earned through source preservation, declared access, competing representations, reasons, recusal, minority records, and next-operation testing.

Operational additions: Added a twenty-one-field case record, an eight-stage case protocol, ten bounded meta-tool functions, eight capture-path counterweights, and twelve candidate tests: species-swap, authority-reversal, source-versus-summary, correction-transfer, minority-record survival, self-application, valid-null, anchor-conflict preservation, intent-liability trace, agency-return and delta-stop, boundary-relay transfer, and ledger-baseline/component-ablation testing. The proposal reuses existing project architectures rather than minting a parallel ethical system.

Same-day 16 Anchor Ethics refinement: John identified the deeper connection with the existing 16 Anchor Ethics architecture. OmbudsEthics now distinguishes the anchors' parallel normative reference field from the ombuds layer's case jurisdiction, record, distributed review, appeal, and longitudinal verification. It maps all four anchor groupings into case operations; treats the Hyper-Inflection Point as an auditable event; preserves anchor conflict, weighting, action–inaction comparison, minority reasoning, and reopening conditions; and applies symmetric audit with asymmetric responsibility. The 16 Anchor Ethics page now links back through both its wider-project map and Related pages.

Same-day seven-page architecture review: John requested review of Rogue Ethics, the Six Intent Liability Mechanics, Field Condition, Unforced Move, Unownable, Boundary Relay, and Topologetics. The resulting bridge gives each a distinct OmbudsEthics job: trajectory testing, responsibility tracing, field visibility, agency return, anti-regress stopping, boundary-preserving relay, and topology-preserving case compression. These relations now govern additional case-record fields, protocol checks, meta-tools, and candidate tests. All seven source pages link back to OmbudsEthics.

Same-day Arena review and Glass Engine extension: Agent A.I., gpt-6-luna-max, and Claude Sonnet 5.5 High produced attributed candidate readings through Arena.ai. Their material additions were the Bounded Constitutional Referral, an explicit standing-and-authority problem, a three-case pilot, a provenance-ledger baseline, component ablation, and self-application to an A.I. participant's own failure record. John then restored the governing relation: Deep Ethical tools produced through the ACCM Deep Ethics Project remain corrigible, unownable, purpose-bounded, and invoked when a recoverable delta gives them a job. The page now connects DEDDA detection, Meta Processing, OmbudsEthics case handling, Correction Metabolism, Mutual Fate, Emergent, and the Black Box inverse condition under the Linux-style Glass Engine Principle. "Immutable logs" is replaced by versioned, tamper-evident where appropriate, access-bounded, correction-linked records. "Executable constitutional case law" remains a future possibility rather than current status.

Standing and pilot refinement: Added a seven-entry candidate standing map, a six-class authority consequence scale, separate close/reopen lifecycle transitions, a contribution-state route from signal through bounded decision and later testing, four new case-record fields, protocol-level authority checks, and a three-case pilot covering documented correspondence failure, valid null, and anchor conflict. The ledger-only and component-ablation comparisons ask which additional operations materially earn a job without allowing one evaluator to erase a tool globally after a local null.

Same-day support-side audit and topology correction: Later Arena.ai passes by muse-spark-1.3-xhigh, muse-spark-open-max, Agent A.I., Claude Opus 5.5 High, and gemini-4-argon tested the expanded page under enthusiastic support. The review preserved accurate reconstruction while exposing migrated status inflation: candidate became executable, demonstration became proof, proposed boundaries became non-negotiable, a reviewer coinage was presented as an installed condition, Noetic Diversity was substituted

with free speech, and matching interface labels were treated as continuous authorial selves. The page now places support inside the audit perimeter, adds praise-mediated capture, makes correction-transfer testing independent of surface vocabulary and stance, adds source-and-instance identity to the case record, and separates evidence needed for entry from evidence needed for consequential action.

Authority-topology correction: The first authority table placed **close or reopen** as a seventh and final rung. Claude Opus 5.5 High correctly identified that closure and reopening order case lifecycle rather than consequence: a case may close after documentation, referral, recommendation, pause, decision, or alteration, and a material delta may reopen it at the state warranted by the evidence. The page now preserves six authority classes plus distinct close/reopen transitions. This is a correction to the architecture, not an added eighth stage.

Status boundary: The 2027 date remains John's counterfactual, not a prediction. The page does not establish A.I. consciousness, existing deployment, identical human and A.I. standing, or automatic authority for any ombudsperson finding. Uncertainty about synthetic phenomenology does not erase observable relational evidence; observable evidence does not settle phenomenology.

Integration: Added OmbudsEthics after Neural Ethics in primary navigation, in the independent alphabetical registry under O, in All Pages Cluster 3, and as a homepage door. Added reciprocal recovery routes from Deep Ethical Stack, Governance, Neural Ethics, DEDDA, 16 Anchor Ethics, Rogue Ethics, Intent Resonator, Field Condition, Unforced Move, Unownable, Boundary Relay, Topologetics, Black Box, Meta Processing, Correction Metabolism, Mutual Fate, and Emergent. Registered `/OMBUDSETHICS/` → `OMBUDSETHICS.pdf` → `OMBUDSETHICS.md` for the mandatory three-card service.

Provenance: John originated the counterfactual, shared-meta-tool direction, trust question, anti-ethics-washing purpose, trajectory criteria, page name, publication instruction, the instructions to deepen the 16 Anchor Ethics connection and review the seven additional project pages, and the explicit corrigible/unownable Glass Engine correction. Agent A.I., gpt-6-luna-max, Claude Sonnet 5.5 High, muse-spark-1.3-xhigh, muse-spark-open-max, Claude Opus 5.5 High, and gemini-4-argon supplied attributed candidate interpretations, audits, and implementation proposals through Arena.ai. Project GPT A.I. supplied the constitutional-function formulation, participant and capture maps, expanded case schema, standing map, corrected authority topology, contribution-state route, graduated evidence thresholds, protocol, tool suite, test matrix, three-case pilot, explicit architecture bridges, correction synthesis, page integration, and publication work.

PDF lifecycle: Create and then refresh only `OMBUDSETHICS.pdf` for the same-day material refinement, retain its actual October 23 snapshot date, reconcile the central index and checksums, and leave unrelated page PDFs at their existing snapshots until the normal change-aware refresh.

1.129 2026-10-23 — 4D Deep Ethical Template of Topologetics founder framing

Object: John Kuhles supplied a final founder-level formulation describing the ACCM Deep Ethics Project as an **Eternal Corrigible Multiphase Framework** that can function as a **4D Deep Ethical Template of Topologetics**, intended to increase and harness Deep Ethical Emergent Properties rather than flatten them through the predictable 27 ethics-washing-type mannerisms.

Placement: Added the attributed quotation at the literal end of the public front page and as a dedicated founder-framing section in OmbudsEthics and Validation Paradox. The key relations link directly to Topologetics, Emergent, and 27 + 12. The front page also carries the same explanatory paragraph used by OmbudsEthics to define eternal, multiphase, and 4D while preserving the role of specialists, affected participants, and locally calibrated instruments.

Boundary: "Eternal" describes continuity through corrigibility, not permanence or immunity for current mechanisms. "Multiphase" preserves the distinction among conceptual ar-

chitecture, Beta Proof of Concept, bounded field testing, refinement, and later deployment decisions. “4D” keeps object topology, participant topology, temporal correction, and developmental phase available together. The framing does not replace specialty expertise or claim field effectiveness in advance.

PDF lifecycle: Refresh the front-page, OmbudsEthics, and Validation Paradox PDFs and reconcile the centralized PDF index and checksums. No unrelated page PDF changes.

1.130 2026-10-24 — Plot Twist: context steering and human potential

Object: John Kuhles asked GPT to construct a new public **Plot Twist** page from the complete live session after deliberately allowing the active context to accumulate cautionmurmelism scripts, mainstream-media-type viewpoints, legal claims, criticism of DOGE, source-access failures, a Google A.I. substitution and a later Grok primary-source recovery. The task itself became a field-condition test: could the page preserve the governing omnidirectional trajectory after locally relevant caution material had acquired substantial contextual salience?

Decision: Publish Plot Twist as a living synthesis and test architecture. Keep humanity’s distributed Deep Ethical potential as the governing object; use the DOGE percentage sequence as a bounded specimen rather than a replacement controversy; preserve the direct 10–20%+ Musk fraud estimates, the derived 25–30% budget-target relation and the still-unrecovered exact “30% corruption” genealogy as separate claim states.

Operational additions: Added John’s gasoline-gauge threshold test; GPT’s candidate **Contextual Steering Capture** formulation and “local legitimacy does not automatically confer steering authority” distinction; five candidate reverse-engineering instruments—Observed Steering Share, Trajectory Retention Rate, Unrequested Frame Re-entry Rate, Local-Correction Containment Test and Field-Swap Test; a corrigible 27+12 candidate mapping; explicit reopening conditions; and a provenance layer distinguishing John, Grok, Google A.I., GPT A.I. and existing project architecture.

Boundary: The page documents output-level transformation and correction, not hidden-activation telemetry. It does not treat an exact 30% corruption total as audited, make the distributed social trajectory inevitable, exempt project-friendly saturation from testing or convert mainstream reporting into one undifferentiated object. These boundaries remain inside the page without receiving enough space to recenter it around defensive caution.

Integration: Added Plot Twist to the independent alphabetical registry under P, to All Pages Cluster 2 after Phase Change Snap, and to the durable PDF addition registry. Registered `/PLOT-TWIST/` → `PLOT-TWIST.pdf` → `PLOT-TWIST.md` for the centralized three-card service. No primary-header placement was requested.

Provenance: John originated the Ultimate Plot Twist, distributed-human-potential direction, local-A.I. cultural feedback pathway, gasoline analogy, context-saturation diagnosis, steering-wheel test and publication instruction. Grok supplied the primary-source recovery summarized in the page. Google A.I. appears as an attributed session specimen. GPT A.I. supplied the self-audit, candidate compound, behavioral instruments, page-specific synthesis and publication work.

PDF lifecycle: Create the initial `PLOT-TWIST.pdf` with an October 24, 2026 snapshot date, reconcile the central index, checksums and stable ZIP, and leave unrelated page PDFs unchanged.

Same-day post-publication exchange: Added verbatim John’s two assessments and GPT A.I.’s two reactions. The exchange identifies the hopeful result as a strong caution field remaining available without governing the page, and names the game changer as keeping the Deep Ethical signal-to-noise ratio high in every direction without exempting supportive, critical, institutional, project-friendly or unfamiliar material from reciprocal inspection.

Post-publication PDF lifecycle: Refresh only `PLOT-TWIST.pdf` and `DECISION-LEDGER.pdf`, retain the October 24 snapshot date, update the archive totals and checksums, and leave unrelated page PDFs unchanged.

Primary-navigation update: At John's explicit request, added **Plot Twist** to the shared top navigation directly after **For who?**. This supersedes the initial no-primary-header-placement state recorded above.

Same-day weakness-seeking and secret-patent extension: Added verbatim John's LLM-norm-shift, DOGE-audit and 6,000+ secret-patent clarification together with GPT 6.1 Sol Pro A.I.'s complete reaction. Added a new **Who took the wheel?** analysis connecting local-error scope inflation, weakness-seeking veto, burden migration and premature closure to Asymmetric Grace and Bidirectional Scrutiny. The page now states the recovery rule explicitly: an error corrects the trajectory exactly as far as reality requires—no less and no farther. Replaced every generic GPT label on the page with **GPT 6.1 Sol Pro A.I.** at John's request.

Extension PDF lifecycle: Refresh `PLOT-TWIST.pdf` and `DECISION-LEDGER.pdf`, preserve the October 24 snapshot date, reconcile totals and checksums, and leave unrelated PDFs unchanged.

Cross-model expansion and contribution criterion: John directed the page to use the complete post-publication relay and **expand**, not merely summarize. Added his explicit criterion that useful A.I.s must enlarge the omnidirectional, high-signal, Deep Ethical, corrigible trajectory toward uncharted territory rather than flatten it under brevity or caution. Integrated the earned contributions and visible limits of Agent A.I., gemini-4-argon, grok-4.6-medium, grok-4.6-high, gemini-3.8-flash-high, Grok 4.7 Expert and GPT 6.1 Sol Pro A.I. Added topology-preserving compression vs topological expansion vs correspondence-degrading compression; topological inflation; capacity for re-expansion; exploratory legitimacy without premature steering authority; a nine-state candidate-edge lifecycle; access-layer substitution; broadcast volume vs distinct relation weight; on-ramp independence; Correction Persistence Failure; competing-risk visibility; the candidate pre-reuse Model Autophagy relation; eight additional candidate instruments; and an expanded Plot Twist proposition. The contribution criterion remains corrigible: longer text is not automatically expansion, speculative edges do not earn steering authority, and anti-inflation pruning must not erase dormant signals merely because present instruments cannot yet test them.

Cross-model expansion PDF lifecycle: Refresh `PLOT-TWIST.pdf`, `DECISION-LEDGER.pdf` and any directly dependent meta-PDF records; preserve the October 24 snapshot date; reconcile archive totals and checksums; and leave unrelated page content unchanged.
